Uses.—From the small proportion of rhubarb in this preparation it may be surmised that it was intended for infantile disorders. But as the aromatic tincture or the aromatic syrup can readily be employed in doses appropriate to such cases, the need of this officinal preparation is not apparent. The *dose* may be stated at Gm. 8–12 (fʒij–iij).

TINCTURA SABINÆ, *Br.*—Tincture of Savin.

Teinture de sabine, Fr.; *Sadebaumtinktur*, G.

Preparation.—Take of Savin-tops, dried and coarsely powdered, 2½ oz. av.; Proof Spirit 1 pint. Prepare the tincture according to the formula given under Tincturæ. —*Br.*

Proof spirit appears to be hardly strong enough for dissolving the volatile oil and resin contained in savin. The tincture has a brown-green color.

Uses.—Tincture of savin may be employed internally in all cases in which that mode of administering savin is appropriate. *Dose*, Gm. 1.30–4 (♏xx–fʒj).

TINCTURA SANGUINARIÆ, *U. S.*—Tincture of Sanguinaria.

Tincture of bloodroot, E.; *Teinture de sanguinaire*, Fr.; *Blutwurzeltinktur*, G.

Preparation.—Sanguinaria, in No. 60 powder, 150 Gm.; Acetic Acid 20 Cc.; Alcohol, Water, each a sufficient quantity; to make 1000 Cc. Mix alcohol and water in the proportion of 600 Cc. of alcohol to 400 Cc. of water. Moisten the powder with 100 Cc. of the mixture, to which the acetic acid had previously been added, and macerate for twenty-four hours; then pack it firmly in a cylindrical glass percolator, and gradually pour menstruum upon it until 1000 Cc. of tincture are obtained.—*U. S.*

To make 1 quart of tincture of sanguinaria use 5 av. ozs. of sanguinaria, and moisten with 3½ fluidounces of the menstruum (alcohol 3 volumes, water 2 volumes), to which 308 minims of acetic acid had previously been added.

In alcoholic strength the present official menstruum is weaker than that of 1880, which consisted of alcohol 2½ volumes (nearly) and water 1 volume; the addition of acetic acid is valuable, as not only facilitating the exhaustion of the drug, but also as materially adding to the permanency of the tincture. Tincture of sanguinaria has a rich brownish-red color and the bitter, acrid taste of the root.

Uses.—This tincture contains all the virtues of bloodroot. It may be given in *doses* of Gm. 2–4 (f℥ss–j) as an "alterative" and expectorant, and as an emetic in doses of Gm. 4–16 (f℥j–iv).

TINCTURA SCILLÆ, *U. S., Br., P. G.*—Tincture of Squill.

Teinture de scille, Fr.; *Meerzwiebeltinktur*, G.

Preparation.—Squill, in No. 30 powder, 150 Gm.; Alcohol, Water, each a sufficient quantity; to make 1000 Cc. Mix 750 Cc. of alcohol with 250 Cc. of water. Moisten the powder with 200 Cc. of the menstruum, and macerate for twenty-four hours; then pack it moderately in a conical percolator, and gradually pour the remainder of the menstruum upon it; when this has disappeared from the surface, gradually pour on more of the mixture of alcohol and water, using the same proportions as before, and continue the percolation until 1000 Cc. of tincture are obtained.—*U. S.*

To make 1 quart of tincture of squill use 5 av. ozs. of squill, and moisten with 6½ fluidounces of the menstruum (alcohol 3 volumes, water 1 volume).

Squill 2½ oz. av., proof spirit sufficient for 1 pint (Imperial).—*Br.* Squill 1 part, alcohol (sp. gr. 0.912, *F. Cod.*) (sp. gr. 0.894, *P. G.*) 5 parts.

The increase in the alcoholic strength of the official menstruum is decidedly advantageous with a view to extracting less of inert mucilaginous matter. The tincture is of a light yellow-color, with the nauseous bitter taste of squill.

Allied Tincture.—Tinctura scillæ kalina. Macerate for a week squill 8 parts and caustic potassa 1 part in alcohol (sp. gr. 0.894) 50 parts; express and filter. It has a brownish color.—*P. G.* 1872.

Uses.—Tincture of squill is perhaps better adapted than squill in substance for the treatment of *dropsy*. It is generally associated with other medicines, as in the following efficient formula: ℞. Tincture of digitalis f℥ij–f℥iij; tincture of squill f℥ss; compound spirit of juniper f℥ij; sherry wine f℥x; acetate of potassium ℥j. M.—S. A tablespoonful, largely diluted, three times a day. Tincture of squill is said to have produced diuresis when applied to the skin with friction. The *dose* is Gm. 0.60–1.30 (♏x–xx).

TINCTURA SENEGÆ, *Br.*—Tincture of Senega.

Teinture de polygala de Virginie, Fr.; *Senegatinktur*, G.

Preparation.—Take of Senega-root, in coarse powder, 2½ oz. av.; Proof Spirit 1 pint (Imperial). Proceed according to the directions given under Tincturæ.—*Br.* Senega 1 part, alcohol (sp. gr. 0.863) 5 parts.—*F. Cod.*

The tincture has a yellowish-brown color and the acrid taste of senega.

Uses.—This preparation is probably less efficient than the syrup of senega in affections of the air-passages, and than the fluid extract as a stimulant of the uterine functions. The alcohol it contains renders it peculiarly unsuitable in the former, and probably impairs its virtues in the latter case, while it tends to produce a local irritant action upon the stomach. Its *dose* is Gm. 2–8 (f℥ss–ij).

TINCTURA SENNÆ, *Br.*—Tincture of Senna.

Elixir salutis.—Teinture de séné aromatique, Elixir de salut, Fr.; *Sennatinktur*, G.

Preparation.—Take of Senna, broken small, 2½ oz. av.; Raisins, freed from seeds, 2 ounces; Caraway-fruit, bruised, Coriander-fruit, bruised, each ½ ounce; Proof Spirit 1 pint. Prepare 1 pint (Imperial) of tincture according to the formula given under Tincturæ.—*Br.*

Senna 1 part, alcohol (sp. gr. 0.912) 5 parts.—*F. Cod.*

It is used in preparing Mistura sennæ comp., *Br.* The formulas of old pharmacopœias directed rhubarb or jalap in addition to the senna.

Uses.—It is convenient as an addition to cathartic infusions, and particularly to the compound infusion of senna, or "black draught," or along with the tincture of rhubarb in cases that require a stimulating purge, especially in persons of a gouty habit. The *dose* is Gm. 4–16 (f℥j–iv).

TINCTURA SERPENTARIÆ, *U. S., Br.*—Tincture of Serpentaria.

Teinture de serpentaire, Fr.; *Schlangenwurzeltinktur*, G.

Preparation.—Serpentaria, in No. 40 powder, 100 Gm.; Alcohol, Water, each a sufficient quantity; to make 1000 Cc. Mix 650 Cc. of alcohol with 350 Cc. of water. Moisten the powder with 100 Cc. of the menstruum, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour the remainder of the menstruum upon it: when this has disappeared from the surface, gradually pour on more of the mixture of alcohol and water, using the same proportions as before, and continue the percolation until 1000 Cc. of tincture are obtained.—*U. S.*

To make 1 quart of tincture of serpentaria use 3 av. ozs. and 148 grains of serpentaria, and moisten with 3¼ fluidounces of the menstruum (alcohol 65 volumes, water 35 volumes).

Serpentaria 2½ oz. av., proof spirit sufficient to make 1 pint (Imperial).—*Br.*

The tincture has a brownish-yellow color and the camphoraceous odor and taste of the drug.

Uses.—In the low forms of febrile disease for which serpentaria is employed the tincture is the most appropriate form for administering it. It may be associated advantageously in such cases with the compound tincture of cinchona. *Dose*, Gm. 4–8 (f℥j–ij).

TINCTURA STRAMONII SEMINIS, *U. S., Br.*—Tincture of Stramonium-seed.

Tinctura stramonii, Br.—*Tincture of stramonium*, E.; *Teinture de semences de stramoine*, Fr.; *Stechapfelsamentinktur*, G.

Preparation.—Stramonium-seed, in No. 40 powder, 150 Gm.; Diluted Alcohol a sufficient quantity; to make 1000 Cc. Moisten the powder with 100 Cc. of diluted alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour diluted alcohol upon it until 1000 Cc. of tincture are obtained.—*U. S.*

To make 1 quart of tincture of stramonium-seed use 5 av. ozs. of stramonium-seed, and moisten with 3¼ fluidounces of the menstruum (diluted alcohol).

Stramonium-seeds 2½ oz. av., proof spirit sufficient for 1 pint (Imperial).—*Br.*

The tincture has a brownish-yellow color and becomes opalescent with water. The tincture of the first formula is about one-fourth stronger than that of the British formula, and about two-thirds stronger than that of the U. S. P. 1880. Teinture de stramoine (*F. Cod.*) is made from stramonium-leaves 1 part and alcohol (sp. gr. 0.912) 5 parts.

Uses.—Although less frequently used than other preparations of stramonium, the tincture is probably one of the best, whether for internal administration or as a topical anodyne. It would seem appropriate for inhalation, when atomized, in cases of *spasmodic asthma*, and it has been used with marked advantage for the relief of *dysmenorrhœa*. It may also be given internally for the relief of *neuralgia*, and used locally for that affection and for *muscular rheumatism* in anodyne liniments. Even in subacute and chronic *articular rheumatism* it may be employed in the same way with advantage. The average *dose* of the tincture is Gm. 1 (♏xv).

TINCTURA STROPHANTHI, *U. S., Br. Add., P. G., P. A.*—Tincture of Strophanthus.

Teinture de semences de strophanthe, Fr.; *Strophanthussamentinktur*, G.

Preparation.—Strophanthus, in No. 30 powder, 50 Gm.; Alcohol, Water, each a sufficient quantity; to make 1000 Cc. Mix 650 Cc. of alcohol with 350 Cc. of water. Digest the powder with 70 Cc. of the menstruum for two days, then transfer it to a cylindrical percolator, and gradually pour on more menstruum, and continue the percolation very slowly until 1000 Cc. of tincture are obtained.—*U. S.*

To make 1 quart of tincture of strophanthus use 1 av. oz. and 293 grains of strophanthus-seed, and digest for two days with 18 fluidrachms of the menstruum (alcohol 65 volumes, water 35 volumes); afterward percolate very slowly with sufficient menstruum to yield 32 fluidounces of tincture.

Percolate strophanthus, in No. 30 powder, 1 ounce, with ether until the latter passes colorless; dry the mass at a temperature not above 48.9° C. (120° F.), and percolate slowly with rectified spirit until 10 fluidounces have passed; then dilute the percolate with rectified spirit to 1 pint (Imperial).—*Br. Add.*

Macerate 1 part of bruised strophanthus-seed, deprived of as much oil as possible by pressure without heat, with 10 parts of diluted alcohol (spec. grav. 0.894), and remove any oil which may separate from the tincture upon subsequent filtration.—*P. G.*

Strophanthus-seeds are very rich in fixed oil, for the removal of which no provision is made in the U. S. P. formula; it is true the weaker alcoholic menstruum, in which the active glucoside strophanthin is perfectly soluble, will not take up large quantities of the oil; but we think the process given in the National Formulary of the A. P. A., which is practically identical with the directions of the Brit. Pharm., yields a more satisfactory product. The ether used for the removal of the fixed oil does not affect the active virtues of the seed, and the alcoholic tincture has been used by physicians for years. The color of the tincture will depend upon the menstruum employed: made by the U. S. P. and P. G. formulas, the color is brownish-yellow, while if made by the Br. Ph. the color is greenish-yellow. The taste is very bitter.

Uses.—An efficient preparation of strophanthus. *Dose*, 4 to 8 minims.

TINCTURA SUMBUL, *U. S., Br.*—Tincture of Sumbul.

Teinture de sumbul, Fr.; *Sumbultinktur*, G.

Preparation.—Sumbul, in No. 30 powder, 100 Gm.; Alcohol, Water, each a sufficient quantity; to make 1000 Cc. Mix alcohol and water in the proportion of 650 Cc. of alcohol to 350 Cc. of water. Moisten the powder with 100 Cc. of the menstruum, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour on more menstruum until 1000 Cc. of tincture are obtained.—*U. S.*

To make 1 quart of tincture of sumbul use 3 av. ozs. and 148 grains of sumbul, and moisten with 3¼ fluidounces of menstruum (alcohol 65 volumes, water 35 volumes).

Sumbul 2½ oz. av., rectified spirit sufficient for 1 pint (Imperial).—*Br.*

The medicinal strength of tincture of sumbul (U. S. P.) is about the same as that of 1880, but the menstruum has been changed in alcoholic strength to about two-thirds of the former, which is supposed to be sufficiently strong to exhaust the powdered root; considering that the virtues of sumbul reside in an acid and volatile oil, a mixture of alcohol 3 volumes and water 1 volume would appear preferable, as in the case of valerian.

Uses.—This tincture probably possesses all the virtues of sumbul. Its *dose* is Gm. 0.60–2 (♏ x–xxx).

TINCTURA TOLUTANA, *U. S., Br.*—Tincture of Tolu.

Teinture de baume de Tolu, Fr.; *Tolubalsamtinktur*, G.

Preparation.—Balsam of Tolu 100 Gm.; Alcohol a sufficient quantity; to make 1000 Cc. Add the balsam of Tolu to 900 Cc. of alcohol, and macerate until dissolved; then filter through paper, adding, through the filter, enough alcohol to make the tincture measure 1000 Cc.—*U. S.*

To make 1 quart of tincture of Tolu dissolve 3 av. ozs. and 148 grains of balsam of Tolu in 29 fluidounces of alcohol, and add sufficient of the latter to make 32 fluidounces.

Balsam of Tolu 2½ oz. av., rectified spirit sufficient to make 1 pint (Imperial).—*Br.*

Balsam of Tolu 1 part, alcohol (sp. gr. 0.863) 5 parts.—*F. Cod.*

The tincture has a yellowish color, and becomes milky on the addition of water.

Uses.—This preparation is used for little else than to flavor cough mixtures; it is ineligible even for that purpose, since it is decomposed by water. Its flavor, however, remains after the removal of its resin, and in this manner the agreeable officinal syrup is formed. *Dose*, Gm. 4–8 (fʒj–ij).

TINCTURA VALERIANÆ, *U. S., Br., P. G., P. A.*—Tincture of Valerian.

Teinture de valériane, Fr.; *Baldriantinktur*, G.

Preparation.—Valerian, in No. 60 powder 200 Gm.; Alcohol, Water, each a sufficient quantity; to make 1000 Cc. Mix alcohol and water in the proportion of 750 Cc. of alcohol and 250 Cc. of water. Having moistened the powder with 100 Cc. of the menstruum, macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour menstruum upon it until 1000 Cc. of tincture are obtained.—*U. S.*

To make 1 quart of tincture of valerian use 6 av. ozs. and 296 grains of valerian, and moisten with 3¼ fluidounces of the menstruum (alcohol 3 volumes, water 1 volume).

Valerian 2½ oz. av., proof spirit sufficient for 1 pint (Imperial).—*Br.* Valerian 1 part, alcohol (sp. gr. 0.912, *F. Cod.*) (sp. gr. 0.894, *P. G.*) 5 parts.

The alcoholic and medicinal strength of the official tincture has been altered, so that it is now practically identical with those of the French and German Pharmacopœias. The tincture is of a brown or reddish-brown color, varying somewhat with the variety of valerian employed, and has the odor and taste of the drug in a marked degree. On the addition of water it becomes opalescent and turbid.

Allied Tincture.—Tinctura valerianæ ætherea. Valerian 1 part, spirit of ether 5 parts. —*P. G.* Valerian 2 parts, ether (sp. gr. 0.724) 7 parts, alcohol 3 parts.—*F. Cod.* It is of a yellow or brownish-yellow color, and becomes opalescent and turbid on the addition of water.

Uses.—The tincture is much less frequently employed than the other preparations of valerian, although in certain cases it is more efficacious—those, namely, in which a prompt and efficient operation is required. Such cases are the *typhoid state* with predominance of ataxic phenomena and *delirium tremens*. On the other hand, in purely nervous disorders, especially of an hysterical kind, it is far less eligible than the infusion, the oil, the ammoniated tincture, or even the fluid extract of valerian. The *dose* is Gm. 4–8 (fʒj–ij).

TINCTURA VALERIANÆ AMMONIATA, *U. S., Br.*—Ammoniated Tincture of Valerian.

Teinture de valériane ammoniacale, Fr.; *Ammoniakalische Baldriantinktur*, G.

Preparation.—Valerian, in No. 60 powder, 200 Gm.; Aromatic Spirit of Ammonia a sufficient quantity; to make 1000 Cc. Moisten the powder with 200 Cc. of aromatic spirit of ammonia, and macerate for twenty-four hours in a closed vessel; then pack it firmly in a cylindrical glass percolator, and gradually pour aromatic spirit of ammonia upon it until 1000 Cc. of tincture are obtained.—*U. S.*

To make 1 quart of ammoniated tincture of valerian use 6 av. ozs. and 296 grains of valerian, and moisten with 6½ fluidounces of the menstruum (aromatic spirit of ammonia).

Valerian 2½ oz. av., aromatic spirit of ammonia sufficient for 1 pint (Imperial).—*Br.*

The tincture is of a brown color, with the odor and taste of valerian and of ammonia.

Uses.—This preparation may be employed in all the disorders in which the simple tincture is eligible, but it is perhaps best adapted to cases of a purely nervous description, in which its use need not be prolonged. It may be given in *doses* of from Gm. 2–4 (30 to 60 minims) in sweetened water or mucilage, but never in milk. A non-officinal preparation, the elixir of ammonium valerianate, operates in the same manner, but much less energetically. Both are suited to cases of *nervous headache* and of general nervousness with *insomnia*, produced by exhaustion of mind or body. *Dose*, Gm. 4–8 (fʒj–ij).

TINCTURA VANILLÆ, *U. S., P. A.*—Tincture of Vanilla.

Teinture de vanille, Fr.; *Vanilletinktur*, G.

Preparation.—Vanilla, cut into small pieces and bruised, 100 Gm.; Sugar, in coarse powder, 200 Gm.; Alcohol, Water, each a sufficient quantity; to make 1000 Cc. Mix

alcohol and water in the proportion of 650 Cc. of alcohol to 350 Cc. of water. Macerate the vanilla in 500 Cc. of this mixture for twelve hours, then drain off the liquid, and set it aside. Transfer the vanilla to a mortar, beat it with the sugar into a uniform powder, then pack it in a percolator, and pour upon it the reserved liquid. When this has disappeared from the surface gradually pour on the menstruum, and continue the percolation until 1000 Cc. of tincture are obtained.—*U. S.*

To make 1 quart of tincture of vanilla macerate 3 av. ozs. and 148 grains of cut vanilla for twelve hours in 16 fluidounces of a mixture of alcohol 65 volumes, water 35 volumes; drain off the liquid, transfer the vanilla to a mortar, and beat it to powder with 6 av. ozs. and 296 grains of sugar; percolate with the expressed liquid, and afterward with fresh menstruum, until 32 fluidounces have been obtained.

Vanilla, cut, 1 part, alcohol (sp. grav. 0.863) 10 parts.—*F. Cod.*

The first formula agrees in the main with that for *essence* or *fluid extract of vanilla*, given in previous editions of this work; but the strength has been increased about 50 per cent., the commercial essence being usually made from 1 ounce of vanilla to 1 pint of tincture. Maceration of the cut vanilla with a portion of the menstruum previous to beating the former with sugar into powder was already directed in 1880, and facilitates the exhaustion of the bean.

Tincture of vanilla is used only as a flavoring agent.

TINCTURA VERATRI VIRIDIS, *U. S., Br.*—Tincture of Veratrum Viride.

Tincture of green (American) hellebore, E.; *Teinture de vératre vert*, Fr.; *Grün-Nieswurztinktur*, G.

Preparation.—Veratrum Viride, in No. 60 powder, 400 Gm.; Alcohol a sufficient quantity; to make 1000 Cc. Moisten the powder with 150 Cc. of alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour alcohol upon it until 1000 Cc. are obtained.—*U. S.*

To make 1 quart of tincture of veratrum viride use 13 av. ozs. and 155 grains of veratrum viride, and moisten with 5 fluidounces of the menstruum (alcohol).

Veratrum viride 4 oz. av., rectified spirit sufficient for 1 pint (Imperial).—*Br.*

This tincture is now about 20 per cent. weaker than that of the U. S. P. 1880, but still more than twice as strong as that of the Br. P. It is of a deep red-brown color, has a bitter and acrid taste, and becomes opalescent and turbid on the addition of water. The present English title is to be preferred to the older one, as not likely to lead to confounding this preparation with the tincture of Helleborus viridis which is employed in some parts of Europe.

Allied Tinctures.—Veratrum viride not being recognized by the French and German Pharmacopœias, these authorities have adopted a tincture from the closely-allied Veratrum album:

Tinctura veratri, *P. G.*—Teinture d'hellébore blanc (vératre blanc), *Fr.*—White veratrum 1 part, alcohol (sp. grav. 0.863) 5 parts.—*F. Cod.* White veratrum 1 part, alcohol (sp. grav. 0.894) 10 parts.—*P. G.*

Uses.—The American is more than twice as strong as the British tincture, and may be given to adults in *doses* of Gm. 0.40–0.50 (♏ vj–viij) every three hours, and cautiously increased until nausea is felt or the pulse begins to fall. The dose of the British tincture is from Gm. 0.30–1.30 ("5 to 20 minims"). This preparation and the fluid extract have been used hypodermically. Dr. E. R. Squibb suggests as the proper dose "8 to 10 minims of the fluid extract, or double that dose of the tincture, every fifteen minutes at first." The physiological effect may be certain; the therapeutical result is improbable. It may be remarked here, as was implied in the account given of green (American) hellebore itself, that while some of our native physicians exalt this medicine to the rank of a panacea, others condemn its use altogether as scientifically illogical and practically dangerous. Among the latter we desire to be reckoned. The reasons that have led us to this judgment are set forth under Veratrum Viride.

TINCTURA ZINGIBERIS, *U. S., Br., P. G.*—Tincture of Ginger.

Teinture de gingembre, Fr.; *Ingwertinktur*, G.

Preparation.—Ginger, in No. 40 powder, 200 Gm.; Alcohol a sufficient quantity; to make 1000 Cc. Moisten the ginger with 50 Cc. of alcohol, macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour alcohol upon it until 1000 Cc. of tincture are obtained.—*U. S.*

To make 1 quart of tincture of ginger use 6 av. ozs. and 296 grains of ginger, and moisten with 1½ fluidounces of the menstruum (alcohol).

Ginger 2½ oz. av., rectified spirit sufficient for 1 pint (Imperial).—*Br.* Ginger 1 part; alcohol (sp. gr. 0.863, *F. Cod.*) (sp. grav. 0.894, *P. G.*) 5 parts. The tincture is brownish-yellow or reddish, has the aromatic odor and hot taste of ginger, and is rendered milky by water. Diluted alcohol yields a turbid tincture.

Allied Tincture.—Tinctura zingiberis fortior, *Br.*—Strong tincture of ginger, *E.*—Take of ginger, in fine powder, 10 ounces, rectified spirit a sufficiency. Pack the ginger tightly in a percolator, and pour over it carefully ½ pint of the spirit. At the expiration of two hours add more spirit, and let it percolate slowly until 1 pint (Imperial) of tincture has been collected.—*Br.* This has about one-half the strength of the fluid extract of ginger.

Uses.—These tinctures suffice for nearly all the purposes to which ginger can be applied, either internally or externally, and especially to parts slightly affected with muscular *rheumatism*, and to the abdomen in cases of *nausea* or colic; and internally the weaker tincture may be given for flatulent *colic*, *dysmenorrhœa*, etc. The British strong tincture is twice as strong as the American tincture, but neither is as strong as the fluid extract. The latter tincture may be prescribed in *doses* of Gm. 0.60–4 (♏ x–lx), the former in the dose of Gm. 0.30–2 (♏ v–xxx).

TRAGACANTHA, *U. S.*, *Br.*, *P. G.*—Tragacanth.

Gummi tragacantha.—Gomme adragante, F. Cod.; *Traganth*, G.; *Goma tragacanta*, Sp.

A gummy exudation from Astragalus gummifer, *Labillardière*, and from other species of Astragalus. Bentley and Trimen, *Med. Plants*, 73.

Nat. Ord.—Leguminosæ, Papilionaceæ.

Origin.—The genus Astragalus comprises numerous herbaceous, suffruticose, and shrubby species, and is characterized by its flowers having ten stamens, nine of which are united into a bundle, and by having the lower suture of their legumes inflexed so as to make the fruit apparently two-celled. The subgenus Tragacantha has the stipules united with the permanent petioles, which become thorny. According to Boissier and Haussknecht, the principal species yielding tragacanth are Astragalus adscendens, *Bois. et Haussk.*, A. brachycalyx, *Fischer*, A. microcephalus, *Willdenow*, A. pycnocladus, *Bois. et Haussk.*, A. stromatodes, *Bunge*, A. kurdicus, *Bois.*, A. cylleneus, *Bois. et Heldreich* (probably a variety of A. Parnassi, *Boissier*); also, A. verus, *Olivier*, and A. creticus, *Lamarck*. All are low shrubs, indigenous to a portion of the territory lying between Eastern Persia and Greece.

The secretion of tragacanth is due to a transformation of the cell-walls, with their incrusting layers, of the pith and medullary rays contained in the stem and older branches, as was first observed by Hugo von Mohl (1857), whose observations were corroborated by Wigand (1861). The altered tissue is confined in the plant between the wood-wedges with considerable tension, and oozes out with some force on breaking a branch or making an incision.

Collection.—Tragacanth exudes spontaneously either from fissures or from punctures and longitudinal incisions made into the stem and older branches. From such incisions flake tragacanth is obtained, while the spontaneously exuding gum often forms irregularly globular or somewhat conical pieces. The rapidity with which the gum exudes chiefly determines the shape in which it ultimately hardens, and the time which elapses before it is sufficiently hard for collection influences the color of the product, which is white if congealed rapidly, and more or less yellowish and brown if hardened slowly. Tragacanth enters commerce from the ports of Asia Minor and from the Persian Gulf.

Properties.—Tragacanth consists of different layers, either laid upon one another and spirally twisted, or confluent into tear-like masses, or extended into curved, narrow, or broad bands, varying in width between 6 and 25 Mm. (¼ inch and 1 inch), and sometimes 10–13 Cm. (4 or 5 inches) long. These bands are rarely made up of a single layer, but usually are marked with several parallel ridges, indicating the various strata, which are united into broader and thicker laminæ. This form of tragacanth is known as *flake tragacanth* or *leaf gum*, and is the more valuable the whiter and more translucent it is. Smyrna tragacanth is mostly in rather broad and thick flakes, which are yellowish or of a brownish tint, and often prominently ridged. Thin, ribbon-like, and white flakes are produced in Kurdistan and Persia, but are sometimes distinguished in commerce as Syrian tragacanth. Another variety is *vermiform tragacanth*, also called *vermicelli*. It

consists of very narrow, variously coiled, and contorted string-like pieces, the different coils of which are most frequently confluent. *Common tragacanth*, or *sorts*, in Europe known as *traganton*, is the product obtained by spontaneous exudation, forming subglobular, conical, or variously shaped tear-like pieces, with the surface rounded and more or less irregular, and usually of a brownish or brown color, and rather waxy in appearance; but it shows the stratification described above, and, like the white and thin bands, encloses starch.

Tragacanth is hard, tough, difficult to powder, inodorous, and tasteless, insoluble in alcohol and ether, and forms with 50 parts of water a thick, jelly-like mucilage. When diffused in a much larger quantity of water it forms a ropy liquid which may be passed through a filter, leaving behind an insoluble residue, which in contact with iodine acquires a blue color from the presence of starch. The mucilage acquires a yellow color on the addition of caustic soda, and the solution of tragacanth yields clear mixtures with borax, ferric chloride, and sodium silicate, is precipitated by alcohol, thickened by cold lead acetate and subacetate, and precipitated by these salts on heating (Flückiger).

Composition.—The soluble gum is not identical with arabin, though its solution is precipitated by alcohol and ammonium oxalate. The insoluble gum is known as *bassorin*, *traganthin*, *adraganthin*. It is soluble in hydrochloric acid and in ammonia, and is stated to have the composition $C_{12}H_{20}O_{10}$. According to Giraud (1876), tragacanth consists essentially of *pectose* or a closely-allied principle, which on being digested with water is gradually converted into a soluble compound, *pectin*, which is precipitated by alcohol. He regards it as very improbable that tragacanth should originate from a transformation of cellulose, since this body is ordinarily converted into dextrin and sugar, which compounds are not met with in tragacanth. According to this author, the average composition of tragacanth is 20 per cent. water, 60 per cent. pectin compound, 8 to 10 per cent. soluble gum, 3 per cent. cellulose, 2 or 3 per cent. starch, 3 per cent. of mineral constituents, and a trace of nitrogenous matter. By drying, tragacanth loses about 15 per cent. of moisture; the ash contains over half its weight of calcium carbonate.

Allied Gums.—Cherry Gum. The different species of cherry and plum trees frequently yield gummy exudations which harden to irregular nodulous masses, are of a more or less brown color, translucent, and dissolve imperfectly in water. According to Guérin, the insoluble portion of this gum is not identical with bassorin.

Bassora or Kutera Gum is a Persian product of unknown origin, and is met with in yellowish or brownish, semi-transparent, and tasteless masses, which swell considerably with water. It is used in Smyrna for adulterating the cheaper varieties of tragacanth, and is then usually broken into smaller pieces of about the same size as the tragacanth. Such broken pieces are angular, and are said to be sometimes artificially whitened with white lead. This fraud may be readily detected by treating the gum with cold dilute nitric acid, when the presence of lead in the solution may be established without difficulty.

Cashew Gum, *Gomme acajou*, is an exudation of Anacardium occidentale (see page 207), is brown-yellow, translucent, somewhat iridescent, and partly soluble in water. (See also Hog Gum, page 7.)

Other Species of Astragalus.—A. baeticus, *Linné*. An herbaceous annual of the basin of the Mediterranean. Its brownish-yellow, angular, subcubical seeds have been used as a substitute for coffee; they were examined by Trommsdorff (1824).

A. exscapus, *Linné*. This perennial is indigenous to the mountainous parts of Southern and Central Europe. Its root is mucilaginous, somewhat astringent and bitter, and was formerly used as a diuretic. Examined by Fleurot (1833), no peculiar active principle was found.

A. glycyphyllos, *Linné*. The leaves and seeds of this perennial, indigenous to Europe and Northern Asia, have an unpleasant sweet taste and are used as diuretics.

A. crotalariæ, *Gray*. This is a California plant, known as *loco-weed* and *rattle-weed*, and is reported to be poisonous to horses and cattle.

A. mollissimus, *Torrey*. It is indigenous to North America west of the Mississippi from Nebraska to Western Texas. Its leaflets are densely covered with a glossy, soft, white or yellowish pubescence. It is claimed to be poisonous to horses, but from neither this nor the preceding could poisonous principles be isolated.

Action and Uses.—Tragacanth is demulcent and nutritious. It was apparently unknown to the Greek physicians until the fourth or fifth century, and was then used to allay *cough* and *hoarseness* and promote *expectoration*, and, in a word, for all the affections in which gum-arabic has been employed. Its difficult solubility renders it less eligible than the latter gum in most instances. On the other hand, the greater tenaciousness of its mucilage fits it to be a better protective in some local affections, such as *burns*.

A. mollissimus has been studied by Dr. Isaac Ott, who summarizes its effects as follows: It lessens the irritability of the motor nerves and of the sensory ganglia of the central nervous system; has a spinal tetanic action; reduces the action of, and then arrests, the heart; salivates; ultimately it diminishes arterial tension, and dilates the

pupil (*Phila. Med. Times*, xii. 892; *Med. Record*, xxxiii. 197). *A. legum* is described by Gray as a species of the vetch tribe, and as rendering horses valueless. Dr. J. W. Carhart and Dr. Thornton Parker have described its effects on horses. Their hair grows dull, their flesh fails, their gait is staggering, their sight is impaired, and they seem intoxicated (*Med. Record*, xxxi. 10, 130). It does not appear to have affected man nor any animals but those of the equine species.

TRILLIUM.—Bethroot.

Birthroot, *Wakerobin*, E.; *Trillium*, Fr., G.

The rhizome of Trillium erectum, *Linné*.

Nat. Ord.—Liliaceæ.

Origin.—Bethroot is generally stated to be obtained from Trillium pendulum, which is now regarded as a white flowering variety of Tr. erectum, but the drug as met with in the market is evidently derived from different plants, and it is not unlikely that in different localities bethroot is collected from such species of Trillium as may be most abundant. All the species have a simple stem, mostly about 30 Cm. (1 foot) high, bearing at its apex a single hexandrous flower, and beneath it a whorl of three leaves, which are reticulate-palmately veined and usually broadly ovate or rhomboid in shape. The fruit is a triangular-ovate, three-celled, and many-seeded dark purple or red berry. The different species grow in moist thickets and shady woods in various parts of the United States and Canada. Two of the species have the dark-purple flower sessile between the leaves—namely, Tr. sessile, *Linné*, with erect petal and sessile leaves, and Tr. recurvatum, *Beck*, with recurved petals and stalked leaves. Two species have white flowers on erect peduncles and petiolate leaves—namely, Tr. nivale, *Riddell*, with the leaves and petals obtuse, and Tr. erythrocarpum, *Michaux*, with pointed leaves and petals, and the latter striped with purple near the base. Tr. cernuum, *Linné*, and Tr. stylosum, *Nuttall*, have white or rose-colored flowers on peduncles which are deflexed under the leaves, the last-named species being distinguished by the partly-united styles. Tr. erectum, *Linné*, bears a nodding and finally deflexed flower, with dark-purple spreading petals, or in the variety album (Tr. pendulum, *Muhlenberg*) with greenish-white or yellowish petals. The variety declinatum has a horizontal peduncle and white or pink-colored petals. Tr. grandiflorum, *Salisbury*, has a large white or rose-colored suberect flower.

Description.—Bethroot is a subglobular, oblong, or nearly obconical and oblique rhizome, which is truncate at the lower end and terminates above with a short tuft of sheathing leaf-bases. The rhizome is 25–38 Mm. (1 or 1½ inches) long, 12–18 Mm. (½ to ¾ inch) in diameter, slightly flattened, finely but distinctly annulate, and, particularly in the upper portion, beset with circular rows of straw-colored or pale-brownish rootlets or with the short remnants of the same. Bethroot is externally of a yellowish orange-brown color, internally whitish or more frequently yellowish or light-brown, and upon transverse section is seen to be composed of rather spongy parenchyma and of small scattered fibro-vascular bundles, which are circular, elongated, or irregularly curved, and more numerous toward the circumference than near the centre. It is inodorous or nearly so, and has a sweetish, astringent, afterward bitter and acrid taste.

Constituents.—On moistening a section of bethroot with solution of iodine the tissue assumes a uniform blue color, with the exception of the wood-bundles, proving the presence of starch in the parenchyma. From an investigation by Prof. E. S. Wayne (1856), it appears that on evaporating the tincture and diluting with water fatty and resinous matter, and perhaps a little volatile oil, are separated, and that from the aqueous liquid tannin and coloring matter are precipitated by lead acetate and subacetate, while the acrid principle remains in solution. On removing the excess of lead by sulphuric acid and filtering, the acrid principle, or probably a decomposition-product of it, is deposited as a gelatinous mass, soluble in alcohol, but insoluble in water, and producing with it on agitation a permanent foam. The principle deserves further investigation.

Action and Uses.—This is one of the plants used as a medicine by the American aborigines. Its acrid principle causes it to irritate the mouth and throat when chewed, and increase the flow of saliva. It is reputed to be astringent, tonic, and alterative, and to have a special action upon the uterine system, controlling *menorrhagia* and quickening the uterine contractions during *parturition*. It thus received the name of "birthwort." In large doses the root is alleged to be emetic, and the bruised herb has been applied with supposed advantage to unhealthy *ulcers* and to *tumors*. Trillium erectum appears to be the most active species. The *dose* of its dried and powdered root is stated at Gm. 4 (℥j).

TRIMETHYLAMINA.—Trimethylamine.

Triméthylamine, Fr.; *Trimethylamin*, G.

Formula $N(CH_3)_3$. Molecular weight 58.92.

Origin and Preparation.—This compound, frequently incorrectly called *propylamine*, with which it is isomeric, has been obtained from ergot (*secaline*), from the leaves of Beta vulgaris and Chenopodium vulvaria, from the flowers of Arnica montana, Pyrus communis, Sorbus aucuparia, and Cratægus oxyacantha, and from cod-liver oil, bone oil, and guano. It is also produced on heating codeine with potassa, but may be economically obtained from herring-pickle, which contains this alkaloid in considerable quantity and owes to it its peculiar odor. A mixture of herring-pickle and lime is subjected to distillation, the alkaline distillate is neutralized with hydrochloric acid and evaporated, and the saline residue is treated with absolute alcohol, which leaves ammonium chloride undissolved. The alcoholic solution is evaporated, the residue redissolved in a little water, and again carefully distilled with lime. If the vapors are first passed through an empty bottle before they are condensed by means of ice or conducted into water, several less volatile alkaloids are separated in the bottle. Large quantities of trimethylamine are now obtained from the residues left in the preparation of sugar from beets.

Properties.—In its pure state trimethylamine is a colorless, thin, and strongly alkaline liquid having a strong ammoniacal odor modified by the peculiar odor of herring-pickle, and boiling at 9.8° C. (49.6° F.). At ordinary temperatures it is a colorless, inflammable gas. It is readily soluble in water and alcohol, and an aqueous solution of it has been sold as *propylamine*. Trimethylamine chloroplatinate is soluble in alcohol and water, crystallizes in well-defined orange-colored octahedrons, and contains 37.21 per cent. of platinum. More characteristic, particularly in the presence of methylamine and allied bases, is the double salt with gold, which is very sparingly soluble in cold water, and has the composition $N(CH_3)_3HCl.AuCl_3$ (Hesse, 1857, 1883).

Trimethylamine hydrochloride, $N(CH_3)_3HCl$, is obtained on neutralizing the alkaloid with hydrochloric acid and evaporating. It crystallizes in white or colorless prisms. is nearly inodorous, has a saline pungent taste, is very deliquescent on exposure, and dissolves freely in water and alcohol.

Allied Compounds.—Amylamina, $NH_2C_5H_{11}$, is a colorless liquid, having a penetrating ammoniacal odor, and the density 0.7503 at 18° C., and boiling at 95° C. (203° F.). The hydrochlorate crystallizes in octahedrons, is freely soluble in water and alcohol, and is insoluble in ether.

Propylamina, $NH_2C_3H_7$, is a colorless, strongly refracting, inflammable liquid of an ammoniacal odor, boiling at 50° C. (122° F.), and yielding with platinic chloride a double salt, which crystallizes in orange-yellow clinorhombic plates.

Methylamina, NH_2CH_3, and Dimethylamina, $NH(CH_3)_2$, are colorless inflammable gases of an ammoniacal odor, very soluble in water, and condensing to colorless liquids, the former at − 18° C. (0.4° F.), the latter below 8° C. (46.4° F.).

Bilineurina, Cholina, $C_5H_{13}NO_2$, is obtained by boiling bile with caustic baryta, and in a similar manner from brain, yelk of egg (see Vitellus), and mustard-seed (*sinkaline*). It is present also in cotton-seed, fenugreek, fly agaric, herring-pickle; is formed in the human corpse in the beginning of decomposition, and has also been prepared synthetically. It is a colorless, syrupy, non-volatile liquid of a strongly alkaline reaction, very hygroscopic, combining readily with carbon dioxide, and soluble in alcohol or water in all proportions; on heating it gives off trimethylamine, and on boiling its aqueous solution the same alkaloid is given off and ethyleneglycol produced. On treating its hydroiodide with silver oxide, the anhydrous base, $C_5H_{13}NO$, is separated. By careful oxidation *betaine*, $C_5H_{11}NO_2$ (see p. 591), is produced.

Action and Uses.—Applied to the sound skin, trimethylamine is negative in its action unless friction is employed, in which case it causes redness very much as ammonia does. Upon the mucous membrane it acts as a strong irritant, causing a lively sense of burning, with redness, and if allowed to continue its action it produces superficial ulceration. Its taste is ammoniacal and saline, and if taken in a large dose and undiluted it occasions a burning sensation in the throat, œsophagus, and stomach. Propylamine and trimethylamine hydrochloride agree in their effects; 30 or 40 grains of the former or 10 grains of the latter will reduce the pulse about ten beats in the minute, and under the influence of the muriate the temperature may fall 1° or 2° F. In febrile rheumatism the decline of the pulse-rate and temperature is more decided. But the medicine causes neither diaphoresis, diuresis, colic, nor diarrhœa.

The disease in connection with which trimethylamine was first brought into notice, and the only one in which its importance as a medicine was recognized, is *articular rheu-*

matism. It does not appear what motives first led to its use in the treatment of this affection by Awenarius of St. Petersburg, who between 1854 and 1856 treated by its means more than two hundred and fifty rheumatic patients, and affirmed that it dissipated the pain of the acute disease from one day to another. Isolated statements attributing to it a similar efficacy were made in France previous to 1864; but in 1870, Lagrange confirmed them, and in 1873, Dujardin-Beaumetz gave the history of seven cases of acute articular rheumatism which were cured in a very short time by trimethylamine. The improvement in general was rapid, and sometimes great relief was experienced within twelve hours, the pain first and then the swelling subsiding, as well as the fever. Further experience led him to conclude that of all the remedies hitherto used in the treatment of acute articular rheumatism, trimethylamine hydrochloride appeared to be the most efficient. A number of physicians in France have sustained this conclusion by their own experience; a few have published a similar judgment in England, and also in Germany. The less favorable accounts of some others are attributed to their having made use of ill-prepared and inert preparations of the medicine or of those which did not contain a due proportion of the active ingredient. As will be observed, this history of the virtues of trimethylamine in rheumatism has a striking analogy with that of salicylic acid and its salts in the same disease; the same mode of action is attributed to the two medicines, and the same extraordinary curative powers are ascribed to both. These medicines in their turn have been supplanted by antipyrine and antifebrin, so that of the oldest in the group hardly any trace can be found in medical literature since 1879.

Weiss has reported that this medicine is very efficient in the treatment of *chorea*, moderating the spasmodic movements greatly, even when it did not suspend them, when it was given to the extent of Gm. 1–1.30 (gr. xv–xx) a day.

The *dose* of trimethylamine is Gm. 0.10–0.40 (♏ij–vj) every three or four hours. Its extremely offensive taste and smell render necessary its administration in syrup flavored with mint, or anise, or some other aromatic water. To obviate this objection the substitution of the trimethylamine hydrochloride, which has no smell and only a faint taste, has been proposed. Dr. J. L. Tyson has reported favorably of its use in doses of 2 grains every two hours (*Phila. Med. Times*, ix. 374). It is generally given in doses of Gm. 0.10–0.20 (gr. ij–iij), dissolved in a syrup and repeated at similar intervals, so that not less than Gm. 1 (gr. xv) shall be taken during the day.

TRIOSTEUM.—Fever-root; Horse-gentian.

Feverwort, Bastard ipecac, Tinker's weed, E.; *Trioste*, Fr.; *Dreisteinwurzel*, G.

The root of Triosteum perfoliatum, *Linné.*

Nat. Ord.—Caprifoliaceæ.

Origin.—This perennial herb is indigenous to the United States, grows in woodlands, and flowers in June. The stem is from 0.6–1.2 M. (2 to 4 feet) high, soft-hairy, and has opposite spatulate-ovate and entire leaves, which are about 10 Cm. (4 inches) long, abruptly narrowed below and connate at the base. The flowers are in axillary clusters, and have a five-lobed brown-purple corolla, about 12 Mm. (½ inch) long. The ripe fruit is orange-colored, drupaceous, and contains three hard nutlets. All parts of the plant have a bitter taste, but only the rhizome and root are employed. The more slender and rougher Tr. angustifolium, *Linné*, which has greenish flowers and grows chiefly in the Western and Southern United States, is said to have similar properties.

Description.—The rhizome is horizontal, from 15–30 Cm. (6 to 12 inches) long, knotty-cylindrical, about 18 Mm. (¾ inch) thick, somewhat branched, and on the upper side bears numerous cup-shaped scars of the over-ground stems about 6 Mm. (¼ inch) in diameter. The numerous spreading rootlets are inserted mainly on the lower side of the rhizome, and are at their base 6–9 Mm (¼ to ⅜ inch) thick, and 12–25 Cm. (5 to 10 inches) long. Both the rhizome and the rootlets are slightly wrinkled longitudinally, externally of a yellowish-brown color, internally white, and contain a hard, slightly bitter wood, with delicate medullary rays. The bark of the rhizome is thin, that of the roots rather thick, and has a bitter somewhat nauseous taste. Fresh fever-root has a slight disagreeable odor, which is dissipated on drying.

Constituents.—On moistening a transverse section of the roots with solution of iodine a deep-blue color is imparted to the medullary rays and the cambium-layer, but the bark acquires only a slight-blue tinge. Fever-root has not been subjected to analysis; its bitter principle is dissolved both by water and alcohol.

Uses.—A decoction of this plant is said to have been used by some of the American aborigines in the treatment of *fevers* and *female obstructions*. The fresh root, in the dose of Gm. 1.30–2 (gr. xx–xxx), and the extract in the dose of Gm. 0.60–1 (gr. x–xv), purge actively after the manner of jalap. The bark of the root is said to be emetic.

TRITICUM, *U. S.*—Triticum; Couch-grass.

Rhizoma (Radix) graminis.—*Quick-grass, Quickens, Quitch*, E.; *Chiendent officinal, Petit chiendent*, Fr. Cod.; *Queckenwurzel, Grasswurzel*, G.; *Grama*, Sp.

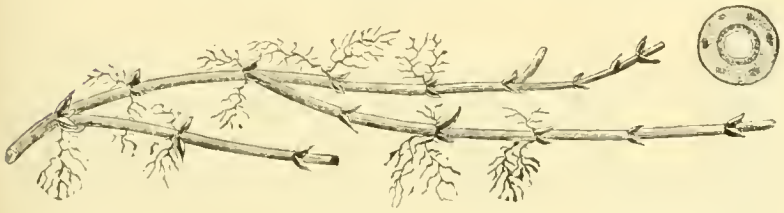
The rhizome of Agropyrum (Triticum, *Linné*) repens, *Beauvais*, collected in the spring and deprived of the rootlets.

Nat. Ord.—Graminaceæ.

Origin.—Couch-grass is a troublesome perennial weed growing along roadsides and in cultivated grounds throughout the northern hemisphere. The plant has a long, jointed, whitish rhizome, with a tuft of fibrous rootlets at each joint. The culm is about 0.6 M. (2 feet) or sometimes 1.2 M. (4 feet) high, and has compressed spikes 7–10 Cm. (3 or 4 inches) long, and four- to eight-flowered spikelets. The florets are variable, mostly awnless, and either pointed or rather obtuse.

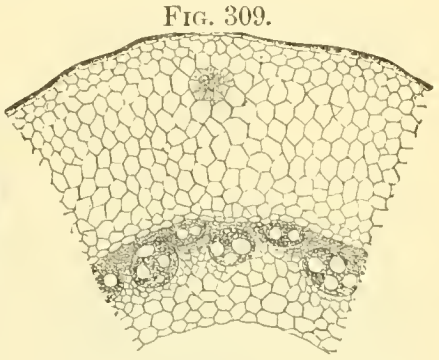
Description.—Couch-grass root is met with in the market cut into short sections, about 5–10 Mm. ($\frac{1}{5}$ to $\frac{2}{5}$ inch) in length, about 2 Mm. ($\frac{1}{12}$ inch) in diameter, of a straw-yellow color, smooth, hollow in the centre, inodorous, and of a sweet taste. The transverse section shows the central cavity surrounded by a narrow layer of delicate parenchyma, projecting somewhat into the equally narrow circle of fibro-vascular bundles, which is separated by the nucleus-sheath from the broad outer layer of parenchyma containing about six or eight isolated, distant fibro-vascular bundles in a loose circle. In Spain and Mexico the rhizome of *Bermuda grass* or *Scotch grass*, Cynodon Dactylon, *Persoon*, is employed like couch-grass.

Fig. 308.



Triticum repens: rhizome; transverse section, magnified 3 diam.

Fig. 309.



Section through portion of rhizome, magnified 65 diam.

Constituents.—The latest analysis of couch-grass root is by Ludwig and H. Müller (1872, 1873), who obtained from it malates, a nitrogenous principle which is readily darkened by heat, fruit-sugar (2.4 or 3.3 per cent.), levulose, and a right-rotating sugar which is not identical with cane-sugar. A peculiar gum-like principle, *triticin*, was isolated, which resembles inulin in its optical behavior, and, like this, may be converted into levulose. It is obtained by exhausting the rhizome with water, neutralizing with baryta, concentrating, precipitating with lead subacetate, removing the excess of lead, treating with animal charcoal, neutralizing the filtrate, again concentrating, and precipitating by alcohol (Reidemeister, 1880). Triticin is amorphous and transparent in thin layers or forms a white powder; it is inodorous, tasteless, very hygroscopic, in damp air deliquescent, insoluble in ether and absolute alcohol, and is oxidized by nitric acid to oxalic acid. Mannit, which was stated by Berzelius (1837) and Völker (1846) to be present in the rhizome, has not been obtained by later investigations; but the extract of couch-grass root may contain calcium lactate, and possibly also mannit, as products resulting from fermentation. Couch-grass root yields about 4.5 per cent. of ash, which is rich in silica.

Allied Drugs.—Sorghum-fruit is 3–4 Mm. ($\frac{1}{8}$ or $\frac{1}{6}$ inch) long, nearly as wide, broadly oval, somewhat flattened, brownish-yellow, and somewhat granular externally, or covered with the glossy dark-purple paleæ; internally white and mealy; inodorous and of a farinaceous and sweetish taste.

Action and Uses.—Couch-grass was employed by the ancients as a vulnerary and for the relief of dysury. They also believed that it removed stone, or at least *gravel*,

from the bladder. In modern times it has been very generally regarded as emollient, antiphlogistic, and diuretic. Its infusion is a common medicinal drink in European hospitals and private life, and is regarded as adapted to relieve thirst, allay fever, and promote urination. It was formerly employed as a popular diet-drink to "purify the blood" in the spring season, and doubtless assisted in purging, through the kidneys, the accumulated organic detritus of a long winter. It was also thought to be very efficient in relieving congestions of the liver and portal circulation with *jaundice* arising under analogous circumstances, and in a less degree chronic *bronchitis*, *skin diseases*, *gout*, etc. It was even alleged to be capable of curing gastric cancer and removing biliary calculi. In truth, it possesses no special medicinal virtues beyond being, when given in infusion, an agreeable drink, which, owing to the sugar it contains, tends to increase the urinary secretion, and thereby palliate irritations of the *urinary passages*. It is best administered in a decoction prepared with Gm. 64–128 in Gm. 1000 (℥ij–iv in Oij) of water, and reduced one-half by boiling. The officinal fluid extract may be used for the same purposes if largely diluted.

The seeds of *Sorghum vulgare*, or broom-corn, are said to have been in common use as a remedy for disorders of the bladder by the plantation negroes of Maryland and Virginia. They made a decoction by boiling 2 ounces of the seed in a quart of water until reduced to a pint. It has been found useful as a palliative in several cases of *cystitis* by Dr. Garnett (*Amer. Jour. of Med. Sci.*, July, 1881, p. 165).

TRITURATIONES, *U. S.*—Triturations.

Triturations, Fr.; *Triturationen*, G.

This term has been used in homœopathic pharmacy in the same sense in which it has been adopted by the U. S. Pharmacopœia—namely, for powders prepared by trituration of a medicinal substance with a definite quantity of milk-sugar. In homœopathy this is done with a view of developing the medicinal power, and two proportions are used, termed the centesimal and the decimal scales; 1 part of the substance being triturated with 99 parts or with 9 parts of the milk-sugar gradually added.

Preparation.—The directions for preparing these powders are very similar to those followed in homœopathic dispensing, excepting that the length of time for mixing and triturating has been omitted.

"Triturations are to be prepared by the following formula: Take of the substance 10 parts, sugar of milk, in moderately fine powder, 90 parts; to make 100 parts. Weigh the substance and sugar of milk separately; then place the substance, previously reduced, if necessary, to a moderately fine powder, in a mortar; add about an equal bulk of sugar of milk, mix well by means of a spatula, and triturate them thoroughly together. Add fresh portions of the sugar of milk from time to time until the whole is added, and continue the trituration until the substance is intimately mixed with the sugar of milk, and finely comminuted."—*U. S.*

Uses.—The utility of this new title is open to very grave doubts on moral as well as therapeutical grounds, the former because the title is borrowed from a fraudulent and illegitimate system of medicine, and the latter because all of the liquid and most of the solid medicines dispensed in this form could as well be given in solution. Moreover, it encourages the prevalent habit, fostered also by the officinal pills, and as erroneous scientifically as it is practically misleading, that the doses of medicines are fixed quantities. Sugar of milk is undoubtedly susceptible of minuter divisions by trituration than cane-sugar, but its use is a practical detail that may very well be left to the physician and the pharmaceutist, and modified according to circumstances.

TRITURATIO ELATERINI, *U. S.*—Trituration of Elaterin.

Trituration d'élatérine, Fr.; *Elaterintrituration*, G.

Preparation.—Elaterin 10 parts, Sugar of Milk 90 parts; to make 100 parts. Mix them thoroughly by trituration.—*U. S.*

Medical Uses.—The average *dose* of elaterin being Gm. 0.004 ($\frac{1}{16}$ grain), and the proportion of the drug in the trituration being one-tenth, it follows that the dose of the latter should be about Gm. 0.05 (gr. $\frac{3}{4}$).

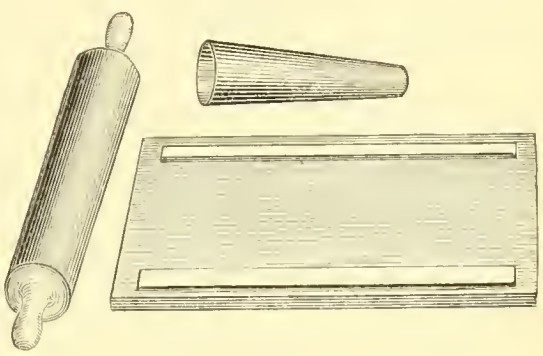
TROCHISCI, *U. S., Br., P. G.*—Troches.

Tabellæ, F. Cod.—*Lozenges*, E.; *Tablettes*, *Pastilles*, F.; *Pastillen*, *Zeltchen*, G.

Troches are mixtures of medicinal substances with sugar or extract of liquorice, formed by the aid of mucilage into stiff, pasty masses, and divided into flat circular, oblong, rectangular, or stellate pieces, usually weighing about 10 or 20 grains. A cylindrical shape has been adopted for a few of the official lozenges. The French Codex makes a distinction between tablettes and pastilles, and applies the former term to the preparations just defined, and restricts the term *pastilles* to the sugar drops described below.

Preparation.—The dry ingredients are separately reduced to fine powders and thoroughly mixed in a mortar or by sifting. Volatile oils, tinctures, and similar liquids should now be intimately incorporated with the powder, and the whole beaten into a rather firm mass by the addition of mucilage of tragacanth or of acacia. The mass is then rolled out into sheets of suitable thickness and cut into the requisite number of pieces by a punch. A hard and smooth board or a polished marble slab, dusted over with finely-powdered sugar, is well adapted for this purpose; and in order to keep the mass at a somewhat elevated temperature while being rolled out the roller is sometimes made of iron or glass and hollow in the interior, so that it may be filled with water of any desired temperature. When lozenges are ordered on extemporaneous prescriptions, the mass is usually rolled out into a square, rectangular, or rhombic cake, and then divided by means of a ruler and knife into the requisite number of pieces, all having the same size and shape. After lozenges have been cut they are spread out on a sieve or other surface and exposed to a current of warm air until they are sufficiently dry.

Fig. 310.



Board, Roller, and Punch for making Lozenges.

The amount of powdered tragacanth necessary for imparting the requisite adhesiveness varies with the nature of the ingredients: 1 part of it is sufficient for 100 parts, and even more, of sugar and similar powders if, after the addition of water, the mass is well beaten. A much larger proportion of tragacanth renders the lozenges, after some time, very hard and slowly soluble. If mucilage of acacia is employed instead of tragacanth, the lozenges become somewhat translucent, and a similar effect is produced by employing the white of eggs as the adhesive material. In order to secure a perfectly smooth paste it is advisable to use bolted sugar, known among confectioners as lozenge sugar, which can be had pure and in almost impalpable powder. In place of mucilage, fruit paste made from red or black currants is frequently employed in the preparation of lozenges: this, aside from its agreeably acidulous taste, is highly prized in the treatment of certain throat affections. Some manufacturers employ a machine with movable dies for cutting lozenges of any desired shape, and for stamping them at the same time with the name of the principal ingredient. A simple instrument for cutting lozenges with a tubular punch has been described by A. D. Marcy in *New Remedies*, 1882, p. 34. Lozenge-boards, adjustable for different sizes, are described by F. L. Slocum and F. E. Harrison in *Amer. Jour. Pharmacy*, 1879, p. 589, and 1880, p. 254.

If the lozenges are to be made of a cylindrical shape, the mass is rolled out into thin cylinders, in a manner similar to that of making pills, and then cut into shorter pieces having the requisite weight. The mass should be sufficiently firm not to flatten on drying, and the rolling-board, instead of being dusted with sugar, is greased with a little olive oil, to prevent the mass from adhering to it. (For a description and sketch of an apparatus by F. C. Hill, suitable for making such lozenges, see *Amer. Jour. Phar.*, 1874, p. 402.)

The general directions of the French Codex for the preparation of tablettes agree with the description given above. But for some years past *compressed tablettes* have been in use, prepared in a manner similar to that in which compressed pills are made (see p. 1238); and this form has been adopted by the German Pharmacopœia, which gives the following general directions: "For preparing *sugar pastilles*, the whole amount of the medicinal substance is intimately mixed with sufficient powdered sugar to make each

lozenge weigh 1 Gm.; alcohol (sp. gr. 0.994) is now carefully added to produce a damp powder, which by compression will form a coherent mass; from this powder the requisite number of lozenges are made. For *chocolate pastilles* a mass is made by melting together, with the aid of a steam-bath, equal weights of cacao and sugar, and a sufficient weight of medicinal substance is added, so as to form lozenges weighing 1 Gm.; the somewhat cooled mass is then divided into the requisite number of lozenges."

The French Codex likewise directs the tablettes to weigh 1 Gm., and permits some kinds to be variously flavored, for which purpose to every 1000 Gm. of mass may be added 1 Gm. of volatile oil of anise, lemon, or peppermint or 10 Gm. of tincture of vanilla; and in case the flavor of rose or orange-flower is desired, the distilled aromatic water is used in the place of water for preparing the mucilage employed in rendering the mass plastic.

Pastilli (Rotulæ) sacchari.—Sugar lozenges, Sugar drops, *E.;* Pastilles, Orbicules, *Fr.;* Zuckerplätzchen, *G.*—This form of lozenges is usually made by the confectioner, and the medication merely is left to the pharmacist. The lozenges are prepared by mixing, in a pan having a suitable lip, some granulated sugar with a sufficient quantity of water to form a pasty mixture; this is heated carefully to prevent empyreuma, until it begins to boil. An additional quantity of sugar is then stirred in to give the requisite consistence; 100 parts of sugar require about 12 to 15 parts of water. The semi-liquid mass is now poured out upon cold, polished sheet iron in such a manner that each drop is kept separate, when, on touching the iron plate, it will congeal into a flattish hemispherical body. The peppermint drops of the French Codex are made in this manner, ½ per cent. of oil of peppermint being incorporated with the sugar and 12½ per cent. of water; this mixture is heated in small portions and dropped in the manner stated. *Chocolate drops* are made by a similar process. The term *trochisques*, formerly used in France for such lozenges, is now usually applied to the little cones obtained in drying clutriated powders (see p. 552).

Rotulæ menthæ piperitæ, *P. G.*—Peppermint drops, *E.;* Pastilles de menthe à la goutte, *Fr.;* Pfefferminzkuchen, *G.*—Dissolve 1 part of oil of peppermint in 2 parts of alcohol; add the solution to 200 parts of sugar drops in a bottle, and well agitate, so as to impregnate them uniformly with the liquid; afterward expose to the air for a few minutes, and when the alcohol has evaporated keep in a stoppered bottle. By substituting other volatile oils for the oil of peppermint, lozenges of any desired flavor may be obtained.

Most of the lozenges of the British Pharmacopœia vary but slightly from 1 Gm. (15.43 grains) in weight, but the majority of the troches of the U. S. Pharmacopœia weigh between 10½ and 12½ grains, or between .68 and .80 Gm., while troches of cubeb weigh 6⅔ grains (.44 Gm.), and troches of potassium chlorate about 24 grains (1.56 Gm.).

In addition to the troches described below, the following have been admitted by the French Codex, of which we give the title and the weight of medicinal ingredient in each: Tablettes de baume de Tolu, .05 Gm.; T. de borate de soude, .10 Gm.; T. de calomel, .05 Gm.; T. de charbon, .50 Gm.; T. de gomme, .01 Gm.; T. de guimauve, .01 Gm.; T. de kermès, .01 Gm.; T. de lichen (made with one-third saccharure, p. 441); T. de manne, .20 Gm.; and T. de soufre, .10 Gm.

TROCHISCI ACIDI TANNICI, *U. S., Br.*—Troches of Tannic Acid.

Tablettes (Pastilles) de tannin, Fr.; *Tanninpastillen*, G.

Preparation.—Tannic Acid 6 Gm.; Sugar, in fine powder, 65 Gm.; Tragacanth, in fine powder, 2 Gm.; Stronger Orange-flower Water a sufficient quantity; to make 100 troches. Rub the powders together until they are thoroughly mixed; then with orange-flower water form a mass, to be divided into 100 troches.—*U. S.*

To make 25 tannin lozenges use 25 grains of tannic acid, 250 grains of sugar, and 8 grains of powdered tragacanth.

Tannic acid 360 grains; tincture of Tolu ½ fluidounce; refined sugar, in powder, 25 oz. av.; gum-acacia, in powder, 1 oz. av.; mucilage of gum-acacia 2 fluidounces; distilled water 1 fluidounce; prepare 720 lozenges.—*Br.*

Trochisci acidi benzoici, *Br.*, are made like the preceding from 360 grains of benzoic acid, but omitting tincture of Tolu.

Uses.—Tannic-acid troches are suitable in relaxed states of the mucous membrane of the mouth, throat, and larynx to allay *cough* produced by irritation of these parts. They may also be used in mild cases of *diarrhœa* after a preliminary evacuation of the bowels.

TROCHISCI AMMONII CHLORIDI, *U. S.*—Troches of Ammonium Chloride.

Tablettes (Pastilles) de sel ammoniac, Fr.; *Salmiakpastillen*, G.

Preparation.—Ammonium Chloride, in fine powder, 10 Gm.; Extract of Glycyrrhiza, in fine powder, 25 Gm.; Sugar, in fine powder, 50 Gm.; Tragacanth, in fine powder, 2 Gm.; Syrup of Tolu a sufficient quantity; to make 100 troches. Rub the powders together until they are thoroughly mixed; then with syrup of Tolu form a mass, to be divided into 100 troches.—*U. S.*

To make 25 ammonium chloride lozenges use 40 grains of ammonium chloride, 100 grains of extract of liquorice, 200 grains of sugar, and 8 grains of powdered tragacanth.

Uses.—These lozenges may be used to palliate subacute and chronic inflammations of the *throat* and *air-passages*, but they are less efficient than the inhalations of the salt recommended elsewhere.

TROCHISCI BISMUTHI, *Br.*—Bismuth Lozenges.

Tabellæ cum subnitrate bismuthico, F. Cod.—*Tablettes (Pastilles) de sous-nitrate de bismuth*, Fr.; *Wismuthpastillen*, G.

Preparation.—Take of Bismuth Subnitrate 1440 grains; Magnesium Carbonate 4 oz. av.; Precipitated Calcium Carbonate 6 ounces; Refined Sugar 29 ounces; Gum-Acacia, in powder, 1 ounce; Mucilage of Gum-Acacia 2 fluidounces; Rose-water a sufficiency. Mix the dry ingredients, then add the mucilage, and form the whole into a proper mass with rose-water. Divide the mass into 720 lozenges, and dry these in a hot-air chamber with a moderate heat. Each lozenge contains 2 grains of bismuth subnitrate.—*Br.*

The corresponding lozenges of the French Codex contain 0.10 Gm. (1.5 grains) of the subnitrate, but no magnesia or calcium carbonate.

Uses.—This form of administering bismuth is very unprofitable, since bismuth does not act except mechanically and by diffusion.

TROCHISCI CATECHU, *U. S., Br.*—Troches of Catechu.

Tabellæ cum catechu, F. Cod.—*Catechu lozenges*, E.; *Tablettes (Pastilles) de cachou*, Fr.; *Katechupastillen*, G.

Preparation.—Catechu, in fine powder, 6 Gm.; Sugar, in fine powder, 65 Gm.; Tragacanth, in fine powder, 2 Gm.; Orange-flower Water a sufficient quantity; to make 100 troches. Rub the powders together until they are thoroughly mixed; then with orange-flower water form a mass, to be divided into 100 troches.—*U. S.*

To make 25 catechu lozenges use 25 grains of catechu, 250 grains of sugar, and 8 grains of powdered tragacanth.

Pale catechu, in powder, 720 grains; refined sugar, in powder, 25 oz. av.; acacia, in powder, 1 oz. av.; mucilage of gum-acacia 2 fluidounces; distilled water a sufficiency; prepare 720 lozenges.—*Br.* Each lozenge contains 1 grain, *U. S.*, *Br.* (0.10 Gm. = 1.5 grains, *F. Cod.*) of catechu.

Uses.—These troches, each containing 1 grain of catechu, are serviceable in the cases mentioned under Trochisci Acidi Tannici. They are generally employed to obviate the *hoarseness* or huskiness of the voice due to prolonged speaking or to slight *pharyngeal* or *laryngeal catarrh*.

TROCHISCI CRETÆ, *U. S.*—Troches of Chalk.

Tablettes (Pastilles) de craie lavée, Fr.; *Kreidepastillen*, G.

Preparation.—Prepared Chalk 25 Gm.; Acacia, in fine powder, 7 Gm.; Spirit of Nutmeg 3 Cc.; Sugar, in fine powder, 40 Gm.; Water a sufficient quantity; to make 100 troches. Rub them together until they are thoroughly mixed; then with water form a mass, to be divided into 100 troches.—*U. S.*

To make 25 chalk lozenges use 100 grains of prepared chalk, 28 grains of acacia, 150 grains of sugar, and 12 minims of spirit of nutmeg.

The spirit of nutmeg which is now used in place of grated nutmeg (1880) should be well triturated with a portion of the sugar before mixing with the other ingredients. Each lozenge contains 4 grains (.26 Gm.) of prepared chalk.

Uses.—Troches of chalk may be used to correct *acidity* of the stomach and a slight tendency to *diarrhœa*.

TROCHISCI CUBEBÆ, *U. S.*—Troches of Cubeb.

Pastilles de cubèbe, Fr.; *Kubebenpastillen*, G.

Preparation.—Oleoresin of Cubeb 4 Gm.; Oil of Sassafras 1 Cc.; Extract of Glycyrrhiza, in fine powder, 25 Gm.; Acacia, in fine powder, 12 Gm.; Syrup of Tolu a sufficient quantity; to make 100 troches. Rub the powders together until they are thoroughly mixed; then add the oleoresin and oil and incorporate them with the mixture. Lastly, with syrup of Tolu form a mass, to be divided into 100 troches.—*U. S.*

To make 25 cubeb lozenges use 16 grains of oleoresin of cubeb, 6 drops of oil of sassafras, 100 grains of extract of liquorice, and 48 grains of powdered acacia.

This is a modification of the formula for *Spitta's lozenges*, from which it differs essentially in the substitution of oleoresin for powdered cubebs. The lozenges are usually made of a cylindrical shape, and each contains about $\frac{2}{3}$ grain of oleoresin of cubeb.

Uses.—These troches are chiefly used in cases of subacute and chronic inflammation of the *pharynx* and *larynx*, especially when these parts are covered with viscid mucus.

TROCHISCI FERRI, *U. S.*—Troches of Iron.

Tablettes (Pastilles) de l'hydrate de fer, Fr.; *Ferrihydrat-Pastillen*, G.

Preparation.—Ferric hydroxide, dried at a temperature not exceeding 80° C. (176° F.), 30 Gm.; Vanilla, cut into slices, 1 Gm.; Sugar, in fine powder, 100 Gm.; Mucilage of Tragacanth a sufficient quantity; to make 100 troches. Rub the vanilla first with a portion of the sugar to a uniform powder, and afterward with the iron and the remainder of the sugar, until they are thoroughly mixed. Then with mucilage of tragacanth form a mass, to be divided into 100 troches.—*U. S.*

To make 25 iron lozenges use 116 grains of carefully dried ferric hydroxide, 4 grains of sliced vanilla bean, and 386 grains of sugar.

Each lozenge contains nearly 5 grains of ferric hydroxide. The French Codex recognizes three lozenges made with soluble salts of iron—namely, Tablettes de lactate de fer, T. de citrate de fer ammoniacal, and T. de tartrate de fer ammoniacal.—*F. Cod.* These are flavored with vanilla, and each lozenge contains .05 Gm. ($\frac{3}{4}$ grain) of the salt.

Uses.—Ferric hydroxide of iron in troches is only a little less objectionable than the reduced iron troches of the British Pharmacopœia. Both deserve to be classed among pharmaceutical and medical superfluities. We may repeat concerning troches of iron what was said of troches of the subcarbonate of iron in a former edition of this work: they are convenient for administering to "refractory children, who may be tempted by their agreeable flavor to take them." Each troche contains Gm. 0.30 (gr. v) of hydrated oxide of iron.

TROCHISCI FERRI REDACTI, *Br.*—Reduced Iron Lozenges.

Tablettes (Pastilles) de fer, Tablettes chalybées, Fr.; *Eisenpastillen*, G.

Preparation.—Take of Reduced Iron 720 grains; Refined Sugar, in powder, 25 oz. av.; Gum-Acacia, in powder, 1 oz. av.; Mucilage of Gum-Acacia, 2 fluidounces; Distilled Water 1 fluidounce or a sufficiency. Mix the iron, sugar, and gum, and add the mucilage and water to form a proper mass. Divide into 720 lozenges, and dry these in a hot-air chamber with a moderate heat. Each lozenge contains 1 grain of reduced iron. —*Br.*

Uses.—It is not easy to discern the merits of this preparation. Reduced iron can be serviceable only when it is acidulated by the gastric acids, and that action is better secured by administering it in powder.

TROCHISCI GLYCYRRHIZÆ ET OPII, *U. S.*—Troches of Glycyrrhiza (Liquorice) and Opium.

Trochisci opii, Br.—*Opium lozenges*, E.; *Pastilles d'opium, P. de réglisse opiacées*, Fr.; *Opiumpastillen*, G.

Preparation.—Extract of Glycyrrhiza, in fine powder, 15 Gm.; Powdered Opium 0.5 Gm.; Acacia, in fine powder, 12 Gm.; Sugar, in fine powder, 20 Gm.; Oil of Anise 0.2 Cc.; to make 100 troches. Rub the powders together until they are thoroughly

mixed; then add the oil of anise, and incorporate it with the mixture. Lastly, with water form a mass, to be divided into 100 troches.—*U. S.*

To make 25 liquorice-and-opium lozenges use 58 grains of extract of liquorice, 2 grains of powdered opium, 48 grains of acacia, 78 grains of sugar, and 1 drop of oil of anise.

Extract of opium 72 grains, tincture of Tolu ½ fluidounce; refined sugar, in powder, 16 oz. av.; gum-acacia, in powder, 2 oz. av.; extract of liquorice 6 oz. av.; distilled water a sufficiency; prepare 720 lozenges.—*Br.*

The lozenge of the first formula (*U. S.*) contains about $\frac{1}{12}$ grain of powdered opium, and that of the second formula (*Br.*) $\frac{1}{10}$ grain of extract of opium. The lozenges of the United States Pharmacopœia are much used under the name of *Wistar's cough lozenges*, and are prepared of a cylindrical shape. Lozenges of the same shape and composition, but with the omission of opium, have been introduced as *liquorice lozenges*, and are similar to the *Trochisci bechici nigri*, which are still used to some extent in Europe, and usually contain a small quantity of orris-root and balsam of Tolu.

Uses.—This popular medicine is well adapted for use in *bronchitis* and *laryngitis* attended with harassing cough, but without marked febrile reaction. Its efficiency is greatly increased in the more acute forms of the affections mentioned by the addition of a minute proportion of tartar emetic, not exceeding the fortieth of a grain, or of half a grain of ipecacuanha, to each troche. On an average, one troche may be taken every three hours, but in general it is better to use the third of a troche every hour. Patients are very apt to use them in excess, and thereby induce constipation and loss of appetite.

TROCHISCI IPECACUANHÆ, *U. S., Br.*—Troches of Ipecac.

Tabellæ cum ipecacuanha, F. Cod.; *Ipecacuanha lozenges*, E.; *Tablettes (Pastilles) d'ipécacuanha*, Fr.; *Brechwurzelpastillen*, G.

Preparation.—Ipecac, in No. 60 powder, 2 Gm.; Tragacanth, in fine powder, 2 Gm.; Sugar, in fine powder, 65 Gm.; Syrup of Orange a sufficient quantity; to make 100 troches. Rub the powders together until they are thoroughly mixed; then with syrup of orange form a mass, to be divided into 100 troches.—*U. S.*

To make 25 ipecac lozenges use 8 grains of powdered ipecac, 8 grains of tragacanth, and 250 grains of sugar.

Ipecacuanha, in powder, 180 grains; refined sugar, in powder, 25 oz. av.; gum-acacia, in powder, 1 oz. av.; mucilage of gum-acacia 2 fluidounces; distilled water 1 fluidounce or a sufficiency; prepare 720 lozenges.—*Br.*

Each lozenge contains about .02 Gm. ($\frac{1}{3}$ grain) *U. S.*, ¼ grain *Br.*, 0.01 Gm. ($\frac{1}{7}$ grain) *F. Cod.*, of ipecacuanha.

Uses.—Ipecacuanha troches are useful in *laryngeal* and *bronchial inflammation* before secretion has been established. One troche, containing a third of a grain of ipecacuanha, may be taken every half hour until the dryness of the air-passages abates or the stomach begins to be nauseated. On the other hand, they are often very serviceable in *humid asthma*, or that asthmatic affection which is met with in cases of pulmonary emphysema complicated with obstructive disease of the heart, especially as they may conveniently be carried about by the patient and used in anticipation of a paroxysm.

TROCHISCI KRAMERIÆ, *U. S.*—Troches of Krameria.

Tablettes (Pastilles) de ratanhia, Fr.; *Ratanhiapastillen*, G.

Preparation.—Extract of Krameria 6 Gm.; Sugar, in fine powder, 65 Gm.; Tragacanth, in fine powder, 2 Gm.; Orange-flower Water a sufficient quantity; to make 100 troches. Rub the powders together until they are thoroughly mixed; then with orange-flower water form a mass, to be divided into 100 troches.—*U. S.*

To make 25 rhatany lozenges use 25 grains of extract of rhatany, 250 grains of sugar, and 8 grains of powdered tragacanth.

Uses.—Krameria troches may be used for the same purposes as tannic acid or catechu troches—*i. e.* for constringing the mucous membrane of the mouth, fauces, larynx, and digestive canal.

TROCHISCI MENTHÆ PIPERITÆ, *U. S.*—Troches of Peppermint.

Tabellæ cum oleo volatilé menthæ piperitæ, Fr. Cod.; *Tablettes de menthe, Pastilles de menthe anglaises*, Fr.; *Pfefferminzpastillen*, G.

Preparation.—Oil of Peppermint 1 Cc.; Sugar, in fine powder, 80 Gm.; Mucilage of Tragacanth a sufficient quantity; to make 100 troches. Rub the oil of peppermint and the sugar together until they are thoroughly mixed; then with mucilage of tragacanth form a mass, to be divided into 100 troches.—*U. S.*

To make 25 peppermint lozenges use 5 drops of oil of peppermint and 310 grains of sugar.

These lozenges, made according to the French Codex, contain 1 per cent of the volatile oil. (See also *Pastilli Sacchari* and *Rotulæ Menthæ Piperitæ*, under the general heading Trochisci.)

Uses.—Peppermint troches are employed to relieve *flatulence* and *colic* and to prevent *sea-sickness* and other forms of *nausea*. They are apt to excite gastric pain when too freely used.

TROCHISCI MORPHINÆ, *Br.*—Morphine Lozenges.

Pastilles de morphine, Fr.; *Morphinpastillen*, G.

Preparation.—Take of Morphine Hydrochlorate 20 grains; Tincture of Tolu ½ fluidounce; Refined Sugar, in powder, 24 oz. av.; Gum-Acacia, in powder, 1 oz. av.; Mucilage of Gum-Acacia a sufficiency; Distilled Water ½ fluidounce. Dissolve the morphine hydrochlorate in the water; add this solution to the tincture of Tolu, previously mixed with 2 ounces of the mucilage; then add the gum and sugar, previously mixed, and more mucilage if necessary to form a proper mass. Divide into 720 lozenges, and dry these in a hot-air chamber with a moderate heat.—*Br.*

Uses.—Each of these lozenges contains about Gm. 0.0018 ($\frac{1}{36}$ grain) of morphine hydrochlorate. They are chiefly used to allay *laryngeal* and *bronchial irritation*.

TROCHISCI MORPHINÆ ET IPECACUANHÆ, *U. S., Br.*—Troches of Morphine and Ipecac.

Morphia and ipecacuanha lozenges, E.; *Tablettes (Pastilles) de morphine et d'ipécacuanha*, Fr.; *Morphinpastillen mit Brechwurzel*, G.

Preparation.—Morphine Sulphate 0.16 Gm.; Ipecac, in No. 60 powder, 0.5 Gm.; Sugar, in fine powder, 65 Gm.; Oil of Gaultheria 0.2 Cc.; Mucilage of Tragacanth a sufficient quantity; to make 100 troches. Rub the powders together until they are thoroughly mixed; then add the oil of gaultheria, and incorporate it with the mixture. Lastly, with mucilage of tragacanth form a mass, to be divided into 100 troches.—*U. S.*

To make 25 morphine-and-ipecac lozenges use ⅔ grain of morphine sulphate, 2 grains of powdered ipecac, 250 grains of sugar, and 1 drop of oil of gaultheria.

Morphine hydrochlorate 20 grains; ipecacuanha, in fine powder, 60 grains; tincture of Tolu ½ fluidounce; refined sugar, in powder, 24 oz. av.; gum-acacia, in powder, 1 oz. av.; mucilage of gum-acacia a sufficiency; distilled water ½ fluidounce; prepare 720 lozenges.—*Br.*

Uses.—Each of these troches contains about Gm. 0.0016 (gr. $\frac{1}{40}$) of morphine sulphate or hydrochlorate and Gm. 0.005 (gr. $\frac{1}{12}$) of ipecacuanha. They allay *cough* and promote expectoration.

TROCHISCI POTASSII CHLORATIS, *U. S., Br.*—Troches of Potassium Chlorate.

Tabellæ cum chlorate potassico, F. Cod.—*Tablettes (Pastilles) de chlorate de potasse*, Fr.; *Kaliumchlorat-Pastillen*, G.

Preparation.—Potassium Chlorate, in fine powder, 30 Gm.; Sugar, in fine powder, 120 Gm., Tragacanth, in fine powder, 6 Gm.; Spirit of Lemon 1 Cc. Mix the sugar with the tragacanth and the spirit of lemon by trituration in a mortar; then transfer the mixture to a sheet of paper, and by means of a bone spatula mix with it the potassium chlorate, being careful to avoid trituration and pressure, to prevent the mixture from

igniting or exploding. Lastly, with water form a mass, to be divided into 100 troches.—*U. S.*

To make 25 potassium chlorate lozenges use 116 grains of finely-powdered potassium chlorate, 465 grains of sugar, 25 grains of tragacanth, and 6 drops of spirit of lemon.

Take of potassium chlorate, in powder, 3600 grains; refined sugar, in powder, 25 ounces; gum-acacia, in powder, 1 ounce; mucilage of gum-acacia, 2 fluidounces; distilled water 1 fluidounce or a sufficiency. Mix the powders, and add the mucilage and water to form a proper mass. Divide into 720 lozenges, and dry these in a hot-air chamber with a moderate heat.—*Br.*

By the above formulas lozenges are obtained containing a little over 4½ grains, *U. S.*, and exactly 5 grains, *Br.*, of potassium chlorate; those of the French Codex contain only 0.10 Gm. (1.5 grains) of the same salt.

Uses.—Potassium chlorate troches may be used in the treatment of *aphthæ* and other forms of *ulcer* of the mouth and throat, but they are much less efficient than solutions of the chlorate.

TROCHISCI SANTONINI, *U. S., Br., P. G.*—Troches of Santonin.

Santonin lozenges, E.; *Tablettes (Pastilles) de santonine*, Fr.; *Santoninzeltchen*, G.

Preparation.—Santonin, in fine powder, 3 Gm.; Sugar, in fine powder, 110 Gm.; Tragacanth, in fine powder, 3 Gm.; Stronger Orange-flower Water a sufficient quantity; to make 100 troches. Rub the powders together until they are thoroughly mixed; then with stronger orange-flower water form a mass, to be divided into 100 troches. Santonin troches should be kept in dark, amber-colored bottles.

To make 25 santonin lozenges use 12 grains of santonin, 425 grains of sugar, and 12 grains of tragacanth.

Santonin, 720 grains; refined sugar, in powder, 25 ounces; gum-acacia, in powder, 1 ounce; mucilage of gum-acacia 2 fluidounces; distilled water 1 fluidounce; prepare 720 lozenges.—*Br.*

The official santonin lozenges of the U. S. P. contain about ½ grain of santonin, while those of the Br. and Germ. Pharm. contain 1 grain each.

Uses.—Troches of santonin are a convenient preparation of an efficient anthelmintic. Like other preparations of this medicine, they should be given in the evening to lessen the annoyance produced by the yellow vision they occasion.

TROCHISCI SODII BICARBONATIS, *U. S., Br.*—Troches of Sodium Bicarbonate.

Tabellæ cum bicarbonate sodico, F. Cod.—*Bicarbonate of soda lozenges*, E.; *Tablettes (Pastilles) de bicarbonate de soude, P. de Vichy, P. digestives*, Fr.; *Natronpastillen*, G.

Preparation.—Sodium Bicarbonate 20 Gm.; Sugar, in fine powder, 60 Gm.; Nutmeg, in fine powder, 1 Gm.; Mucilage of Tragacanth a sufficient quantity; to make 100 troches. Rub the sodium bicarbonate with the powders until they are thoroughly mixed; then with mucilage of tragacanth form a mass, to be divided into 100 troches.—*U. S.*

To make 25 sodium bicarbonate lozenges use 75 grains of sodium bicarbonate, 240 grains of sugar, and 4 grains of nutmeg.

Sodium bicarbonate 3600 grains; refined sugar, in powder, 25 oz. av.; gum-acacia, in powder, 1 oz. av.; mucilage of gum-acacia 2 fluidounces; distilled water 1 fluidounce; prepare 720 lozenges.—*Br.*

The freshly-grated nutmeg should be rubbed with a portion of the sugar to a uniform powder, and afterward thoroughly mixed with the remaining powders. In France these lozenges are variously flavored, either with the volatile oil of anise, lemon, or peppermint, with the distilled water of orange-flowers or rose, or with tincture of vanilla. As directed by the different pharmacopœias, the lozenges contain .33 Gm. (5 grains) *Br.*, .20 Gm. (3 grains) *U. S.*, and 0.025 Gm. (⅜ grain) *F. Cod.*, of sodium bicarbonate.

Uses.—Troches of sodium bicarbonate are convenient and useful in cases of habitual *acidity* of the stomach. The utility of the nutmeg they contain is not apparent.

TROCHISCI SULPHURIS, *Br. Add.*—Sulphur Lozenges.

Tablettes (Pastilles) de soufre, Fr.; *Schwefelpastillen*, G.

Preparation.—Precipitated Sulphur 3600 grains; Acid Potassium Tartrate, Acacia, in powder, each 720 grains; Refined Sugar, in powder, 5760 grains; Tincture of Orange-

peel, Mucilage of Acacia, each 720 minims. Mix the tincture of orange-peel with the powders, and add the mucilage, to form a suitable mass. Divide into 720 lozenges, and dry these in a hot-air chamber at a moderate temperature.—*Br. Add.*

Each lozenge contains 5 grains of sulphur.

TROCHISCI ZINGIBERIS, *U. S.*—Troches of Ginger.

Tablettes (*Pastilles*) *de gingembre*, Fr.; *Ingwerpastillen*, G.

Preparation.—Tincture of Ginger 20 Cc.; Tragacanth, in fine powder, 4 Gm.; Sugar, in fine powder, 130 Gm.; Syrup of Ginger a sufficient quantity; to make 100 troches. Mix the tincture of ginger with the sugar, and, having exposed the mixture to the air until dry, reduce it to a fine powder; to this add the tragacanth and mix thoroughly. Lastly, with syrup of ginger form a mass, to be divided into 100 troches.—*U. S.*

To make 25 ginger lozenges use 80 minims of tincture of ginger, 16 grains of tragacanth, and 500 grains of sugar.

Uses.—Troches of ginger are used to relieve flatulent *colic* and quicken laborious digestion.

TUSSILAGO.—Coltsfoot.

Tussilage, *Pas d'âne*, Fr.; *Huflattig*, *Rosshuf*, G.; *Tusilago una de caballo*, Sp.

Tussilago Farfara, *Linné.*

Nat. Ord.—Compositæ, Eupatorieæ.

Origin and Description.—Coltsfoot is a perennial herb which is indigenous to Europe and Northern Asia, has been naturalized in the United States from New England to Pennsylvania, and grows in damp clayey soil and along ditches and brooks. All parts of the plant have been used, but the leaves and flower-heads have been generally employed, and the former have been admitted into the German, the latter into the French, Pharmacopœia. The *rhizome* is creeping, 30–45 Cm. (12 to 18 inches) long, branching, about 3 Mm. (⅛ inch) thick, with joints about 5 Cm. (2 inches) long, radiating on the nodes, and of a grayish-white or pale-brownish color. It is fragile when dry, has a thick whitish bark, yellowish porous wood-wedges, and a prominent pith, is inodorous, and has a mucilaginous, bitterish, and astringent taste. The *leaves* (*Folia farfaræ*, *s. tussilaginis*, P. G.) appear after the flowers, and are radical, long-petiolate, about 10 Cm. (4 inches) long and broad, roundish heart-shaped, angular-toothed, dark-green and smooth above, and white tomentose beneath. They are rather fleshy while fresh, and fragile after drying. The *flower-heads* (*Tussilage* [*capitule*], Fr. Cod.) are smaller than those of dandelion, make their appearance in early spring upon sealy scapes, and have a cylindrical involucre of lance-linear scales in a single row, numerous yellow narrowly-ligulate pistillate ray-florets in several rows, and about twenty tubular staminate disk-florets. The pappus is long, silky-hairy, and white. The dried flowers and leaves are inodorous and have a mucilaginous, bitterish, and somewhat astringent taste.

The rhizome of Asarum canadense is known in some parts of the United States as *coltsfoot-root.*

Constituents.—All parts of coltsfoot contain *mucilage*, a *bitter principle* which has not been isolated, and *tannin*, producing a dark-green precipitate with ferric salts.

Allied Drugs.—Senecio, Groundsel, *E.*; Kreuzkraut, Jacobskraut, *G. Nat. Ord.* Compositæ, Senecionideæ. Several European species of this genus have been employed, among which may be mentioned Sen. Saracenicus, S. Doronicum, S. Jacobæa, and S. vulgaris, *Linné.* The latter, with rayless flower-heads, is a common weed in Europe and sparingly naturalized in North America. It has lanceolate, pinnatifid, and toothed, clasping and rather fleshy leaves, and a cylindrical involucre; it is inodorous and has a bitterish saline and acrid taste. The most common North American species is Senecio aureus, *Linné*, known as *golden ray-weed*, *squaw-weed*, and *life-root.* It is found on the borders of streams, in thickets, and in swamps, and has a thin horizontal rhizome with numerous slender rootlets; long-petioled, round or roundish heart-shaped, and crenately toothed radical leaves; lyrate or pinnatifid, usually lanceolate stem-leaves; and a corymbose inflorescence with many-flowered heads, having bright-yellow pistillate ray-florets. There are many varieties, differing chiefly in the shape of the radical leaves. These plants seem to contain a little tannin and a bitter and an acrid principle.

Action and Uses.—Coltsfoot was anciently renowned in pulmonary affections, for whose relief the smoke of its burning root was inhaled through a funnel; even in modern times it was smoked in pipes for the same purpose by the peasantry of Sweden and Ger-

many. It is demulcent and tonic through its mucilaginous and bitter constituents, and has been compared in its action to Iceland moss. It has been widely used in the treatment of chronic *bronchitis* and for various *scrofulous* affections, both internally and locally. It may be administered in decoction or infusion made with the dried leaves and flowers, Gm. 32 to Gm. 500 (℥j in Oj) of water. The expressed juice is also employed.

Cineraria maritima was said, in 1888, to have been successfully used in Venezuela for the removal of *cataract* by the application to the eye of the juice of the fresh plant. There has, apparently, been no confirmation of the original report.

Senecio, or groundsel, appears to be emollient and also slightly acrid. It was employed by the American aborigines as a vulnerary. In Germany its juice is a domestic remedy for *colic*, *intestinal worms*, etc. It is used in France to prepare gargles for *sore throats*, to make poultices for *boils*, *rheumatic swellings*, and local *cutaneous eruptions*, and to prepare emollient and laxative enemas. Dr. N. S. Davis found that in doses of Gm. 3–6 (♏ xlv–xc) the fluid extract of senecio-root relieved the pains of chronic muscular *rheumatism* (*Phila. Med. Times*, ix. 634). A decoction may be prepared with Gm. 4–8 in Gm. 120 (f℥j–ij in f℥iv) of water.

ULMUS, *U. S.*—Elm ; Slippery Elm.

Ulmi cortex, *Cortex ulmi interior.—Elm-bark*, E. ; *Orme jauve*, *Orme champêtre*, F. Cod. ; *Ulmenrinde*, *Rüsterrinde*, G. ; *Olmo*, Sp.

The inner bark of Ulmus fulva, *Michaux* (*U. S.*, *F. Cod.*), of Ulmus campestris, *Linné* (*F. Cod.*). Bentley and Trimen, *Med. Plants*, 232, 233.

Nat. Ord.—Urticaceæ, Ulmeæ.

Origin.—The elms are trees with alternate, oblique, and slightly heart-shaped, serrate, and straight-veined leaves, and with lateral clusters of small polygamous flowers, having a bell-shaped four- to nine-lobed perianth, the same number of stamens, and two nearly sessile styles. The fruit is a one-celled and one-seeded samara, surrounded with a membranous wing, which is notched or cleft at the apex. The American official elm, known as *slippery elm*, *red elm*, or *moose elm*, is a small or medium-sized tree, which is usually about 9, and occasionally 18, M. (30–60 feet) high, with a diameter of 30–60 Cm. (1 or 2 feet), and with a reddish wood. The leaves are 10–20 Cm. (4 to 8 inches) long, elliptic-oblong, pointed and very rough above ; the flowers are reddish pubescent, precede the leaves, and have the perianth six- to nine-cleft ; the samara is orbicular and not ciliate. The tree grows in woods and rich soil from Canada westward to Lake Superior and Nebraska, and southward to near the Gulf of Mexico, but is most abundant in the Western States. The *white elm*, Ulmus americana, *Linné*, is taller, 18–24 M. (60 to 80 feet) high, bears an oval, on the margin densely ciliate samara, and is a favorite shade-tree in New England.

Ulmus alata, *Michaux*, the winged elm, grows in the Southern United States, where it is known as *wahoo* (see also p. 629). The wood is fine-grained and heavy, and the bark, which on the branches has prominent corky wings, is used for making ropes.

The European official elm is probably a native of Western Asia and Eastern Europe, but now is naturalized or cultivated throughout the greater portion of Asia, Europe, and Northern Africa. It has likewise been introduced in some parts of New England. Its leaves are only about 6 Cm. (2½ inches) long, oval or obovate, and acute or somewhat pointed ; the flowers are mostly pentamerous, and the samara is roundish-obovate, smooth, and has the seed placed near the apical notch. The European *black elm*, Ulmus effusa, *Willdenow*, which has larger ovate or elliptical leaves and roundish-elliptic ciliate fruits, likewise furnishes some elm-bark.

Description.—Slippery-elm bark is met with in commerce in flat pieces, consisting of the liber only, the corky layer being removed before drying, and usually 1 M. or so long and 10–15 Cm. (4 or 6 inches) broad. It is about 3 Mm. (⅛ inch) thick, is externally of a very light-cinnamon color or pale brownish-white, smooth, occasionally with small fragments of the corky layer adhering, and upon the inner surface grayish-white, finely ridged longitudinally, and usually more or less woolly from some detached bast-fibres. The bark breaks, or rather tears, readily in a longitudinal direction, the fragments adhering together with the wavy bast-fibres. It breaks with some difficulty in a transverse direction with a fibrous and mealy fracture, and when cut transversely the bast-fibres are seen arranged in tangential rows, imbedded in a loose parenchyma, and dissected by numerous fine medullary rays, giving to the transverse section a delicately checkered appearance. Slippery-elm bark has a slight but distinct odor, resembling that

of fenugreek, and a mucilaginous, insipid taste. It is also met with as a coarse fibrous and as a somewhat fine and uniform powder, both having a light fawn-color.

European elm-bark.—It resembles the preceding, but is usually rather thinner, upon both surfaces of a cinnamon color, nearly inodorous, and of a mucilaginous, bitterish, and astringent taste.

Constituents.—Both barks contain a considerable amount of mucilage, which, as obtained from the European elm, according to Bracounot (1846), resembles the mucilage of flaxseed. The mucilage of slippery-elm bark is precipitated by lead acetate, but alcohol separates from its solution a gelatinous liquid; starch is present in small grains. European elm-bark contains a small quantity of a bitter principle which has not been isolated, and a little tannin, which is precipitated by gelatin and the salts of most metals, gives a dingy-green precipitate with ferric chloride, reduces gold and silver salts, is a glucoside, and on fusion with potassa yields pyrocatechin and acetic and butyric acids (Johansen, 1875). Starch is usually not present in the bast-layer of this bark.

Action and Uses.—Slippery-elm bark is highly demulcent, and in some degree nutritious. It is grateful to the taste, and does not readily disorder the stomach. Like the inner bark of the European elm (U. Campestris), which is slightly astringent, it has been used with alleged advantage in chronic *cutaneous eruptions*, including some of syphilitic origin. It is also asserted to be a remedy for *tape-worm*. It is, however, chiefly employed in medicine to produce a mucilage which is officinal. The fibrous bark, disintegrated so as to form a mass of flexible spongy tissue, is, like sea-tangle, readily moulded into tents, which are made use of to dilate the neck of the *uterus*, *fistulous openings*, etc., and which do not so readily become offensive as sponge tents. They have also been saturated with various medicinal extracts and used as vaginal and rectal suppositories. (Their preparation was described by Tuckerman, *Boston Med. and Surg. Jour.*, Jan. 1881, p. 46.)

UNGUENTA, *U. S., Br., F. Cod., P. G.*—Ointments.

Pomata, F. Cod.—*Pommades*, *Onguents*, Fr.; *Salben*, G.; *Unguentos*, Sp.

Preparation.—Ointments are unctuous preparations of such a consistence that they may be easily rubbed on the skin, and when in contact with it are gradually liquefied. They consist chiefly of benzoinated lard, or lard which is combined in some cases with a small quantity (about one-fifth) of wax, yellow wax being very properly preferred by the U. S. P. and P. G.; in some cases soft paraffin (petrolatum or paraffin ointment, see p. 1208) is used for the base. In the latter case the ointment is prepared by careful trituration; but if wax is a constituent, this is first melted by a moderate heat, and the lard added in small quantities, or previously heated to about the same temperature: the ingredients being thoroughly liquefied, the vessel is removed from the fire, and its contents beaten with a spatula or transferred to a warm mortar, and then well stirred with the pestle to prevent the partial separation of the wax. The addition of aqueous liquids, which should not be too cold, is made in small quantities, and with continued stirring or beating, as soon as the ointment begins to assume an opaque appearance. In all cases the operation should be continued until the temperature of the ointment has been reduced to that of the surrounding atmosphere, and until the preparation is perfectly smooth and homogeneous. Solid substances may be incorporated in a similar manner, provided they have been previously reduced to an impalpable powder. But in most cases, and more particularly when the powder is heavy, much better and more uniform ointments are obtained by triturating the solid material until a powder is obtained, adding a small quantity of oil or of the ointment, and continuing the trituration until all signs of grittiness have disappeared; after which the remaining portion of the ointment may be gradually added and thoroughly incorporated. Salts and other substances which are soluble in water are often conveniently combined with the fatty base by dissolving them in a small quantity of hot water and incorporating this solution in a warm mortar, with the ointment gradually added. If extracts are to be added to ointments, they should be thoroughly softened in a warm mortar, by trituration with a little water, before the fat is added in small portions and with continued trituration. Alcoholic liquids, except when used in very small proportions, are less conveniently incorporated with ointments than concentrated aqueous solutions. Whenever camphor is to be mixed with an ointment, it should be added after extracts and all other ingredients have been incorporated with

the fatty vehicle: in order to ensure its ready solution in the fat, camphor should always be used in the form of fine powder.

Most of the European pharmacopœias make no distinction between cerates and ointments, but designate both classes as *unguenta*. In France the term *onguent* is usually confined to an ointment into the composition of which resinous substances enter, while ointments with a purely fatty base are designated as *pommades*, and, if the base be a mixture of wax and fat, as cerates. In Europe olive oil or almond oil, melted together with some wax, is frequently employed as the base for ointments in preference to lard. (See also CERATA (p. 432), STEATINA (p. 433), GLYCERITUM AMYLI and GLYCELÆUM (p. 783).)

Preservation.—With few exceptions, ointments should be prepared extemporaneously when wanted for use. The fats should in all cases be free from incipient rancidity, and, if carefully prepared, the ointments may be kept for a limited time in well-closed vessels and in a cool place, at a temperature of about 15° C. (59° F.).

In addition to the formulas given farther on, the following are contained in *Br. P.* 1885:

UNGUENTUM ACIDI BORICI. Boric acid 1 oz.; soft paraffin 4 oz.; hard paraffin 2 oz.

UNGUENTUM ACIDI SALICYLICI. Salicylic acid 60 gr.; soft paraffin 1080 gr.; hard paraffin 540 gr.

UNGUENTUM CONII. Hemlock-juice 2 fluidounces. Evaporate to 2 fluidrachms at a temperature not exceeding 60° C. (140° F.); add boric acid 10 grains and hydrous wool-fat ¾ ounce, and mix thoroughly.

UNGUENTUM EUCALYPTI. Oil of eucalyptus 1 oz.; soft paraffin 2 oz.; hard paraffin 2 oz.

UNGUENTUM GLYCERINI PLUMBI SUBACETATIS. Glycerin of lead subacetate 3 oz.; soft paraffin 12 oz.; hard paraffin 4 oz.

UNGUENTUM HAMAMELIDIS. Mix liquid extract of hamamelis 50 minims with simple ointment 410 grains.

UNGUENTUM STAPHISAGRIÆ. Stavesacre-seeds 4 oz. Crush and macerate them for two hours in benzoated lard 8 oz., melted over a water-bath; strain and cool.

UNGUENTUM, *U. S.*—OINTMENT.

Unguentum simplex, Br., P. A.; *Unguentum adipis.—Simple ointment*, E.; *Pommade simple*, Fr.; *Wachssalbe*, G.

Preparation.—Lard 800 Gm.; Yellow Wax 200 Gm.; to make 1000 Gm. Melt the wax and add the lard gradually; then stir the mixture constantly while cooling.—*U. S.*

White wax 2 oz., benzoated lard 3 oz., almond oil 3 fluidounces. Melt the wax and lard in the oil on a water-bath; then remove the mixture, and stir constantly while it cools.—*Br.*

Uses.—Simple ointment, as it was formerly and more appropriately called, is used as a protective for sores and excoriations and to facilitate the introduction of the hand or finger, surgical instruments, etc. into the urethra, vagina, rectum, etc.

UNGUENTUM ACIDI CARBOLICI, *U. S.*, *Br.*—OINTMENT OF CARBOLIC ACID.

Pommade phénique, Fr.; *Phenolsalbe*, G.

Preparation.—Carbolic Acid 5 Gm.; Ointment 95 Gm.; to make 100 Gm. Mix them thoroughly.—*U. S.*

Each troyounce of the official ointment is composed of 24 grains of carbolic acid and 456 grains of ointment, and is exactly of one-half the strength of the carbolic-acid ointment of 1880.

Carbolic acid 60 gr.; soft paraffin 720 gr.; hard paraffin 360 gr. Melt and mix.—*Br.*

Uses.—Carbolic-acid ointment has been used in the treatment of *lupus* and other diseases of the skin, but carbolized oil is preferable as a dressing for wounds. A similar 5 per cent. solution in oil has been found a safe and efficient surgical dressing.

UNGUENTUM ACIDI TANNICI, *U. S.*—OINTMENT OF TANNIC ACID.

Pommade de tannin, Fr.; *Tanninsalbe*, G.

Preparation.—Tannic Acid 20 Gm.; Benzoinated Lard 80 Gm.; to make 100 Gm.

Rub the tannic acid with the benzoinated lard, gradually added, until they are thoroughly mixed, avoiding the use of an iron spatula.—*U. S.*

Each troyounce of tannic-acid ointment is composed of 96 grains of tannic acid and 384 grains of benzoinated lard; the acid should be rubbed into an impalpable powder, and only horn, porcelain, or glass utensils used in mixing the ointment, so as to avoid darkening of the color.

Uses.—No ointment made with a vegetable astringent is as powerful as a solution of the same substance in water, or even in glycerin. Tannic-acid ointment is no exception to the rule. This preparation may, however, be applied on tampons to the vagina, and introduced into the rectum, in relaxed states of these parts.

UNGUENTUM ACONITINÆ, *Br.*—Ointment of Aconitine.

Pommade d'aconitine, Fr.; *Aconitinsalbe*, G.

Preparation.—Take of Aconitine 8 grains; Rectified Spirit ½ fluidrachm; Benzoated Lard 1 ounce. Dissolve the aconitine in the spirit, add the lard, and mix thoroughly.—*Br.*

Uses.—This powerful local anæsthetic is chiefly of use in *neuralgia* of the superficial nerves, especially of the head, face, and trunk. It should be applied, by means of a soft thick brush or small pledget of lint, over the points of emergence and the terminal distribution of the affected nerves. It should not be allowed to touch denuded cutaneous surfaces or mucous membranes.

UNGUENTUM ANTIMONII TARTARATI, *Br.*—Ointment of Tartarated Antimony.

Pomatum stibiatum, F. Cod.; *Unguentum tartari stibiati*, P. G.; *Unguentum antimonii, Ung. stibio-kali tartarici, Ung. stibiatum.—Antimonial ointment*, E.; *Pommade stibiée, P. d'Autenrieth*, Fr.; *Brechweinsteinsalbe, Pockensalbe*, G.

Preparation.—Take of Tartarated Antimony, in very fine powder, ¼ oz.; Simple Ointment 1 oz.; mix thoroughly.—*Br.*

Tartar emetic 1 part, benzoinated lard 3 parts.—*F. Cod.* Tartar emetic 1 part, paraffin ointment 4 parts.—*P. G.*

Uses.—Antimonial ointment is occasionally employed to produce its characteristic pustular eruption in cases requiring vigorous counter-irritation, but the painful ulcers and the sloughs it sometimes occasioned, and the permanent scars it often left behind, have caused it to be generally abandoned, and there is no reason for a revival of its use.

UNGUENTUM AQUÆ ROSÆ, *U. S.*—Ointment of Rose-water.

Unguentum leniens, P. G.—*Unguentum emolliens*, P. A.—*Cold cream*, E., Fr., G.

Preparation.—Spermaceti, 125 Gm.; White Wax, 120 Gm.; Expressed Oil of Almond, 600 Cc.: Stronger Rose-water, 190 Cc.; Sodium Borate, in fine powder, 5 Gm. Reduce the spermaceti and white wax to fine shavings, and melt them at a moderate heat. Then add the expressed oil of almond, pour the mixture into a warmed, shallow wedgewood mortar, carefully add, without stirring, the whole of the stronger rose-water, in which the sodium borate had previously been dissolved, and then stir rapidly and continuously until the mixture becomes uniformly soft and creamy.—*U. S.*

Each troyounce of rose-water ointment contains 62.5 grains of spermaceti, 60 grains of white wax, 275 grains of oil of almond (expressed), 2.5 grains of borax, and 1½ fluidrachms of stronger rose-water.

The present official formula differs from that of 1880 in ordering increased proportions of spermaceti, white wax, and expressed oil of almond, while the amount of water is reduced to about two-thirds: this change will yield a more permanent ointment, and we can see no advantage in the addition of borax, which may cause trouble when cold cream is ordered in ointments with calomel, mercuric oxide, cocaine salts, etc. By warming the rose-water before adding it to the fats the danger of a granular ointment by partial precipitation of the spermaceti is obviated.

Other pharmacopœias direct: Almond oil 215, spermaceti 60, white wax 30, rose-water 60, tincture of benzoin 15 Gm., oil of rose 10 drops.—*F. Cod.* Almond oil 32, spermaceti 5, white wax 4, rose-water 16 parts, oil of rose 1 drop to 50 Gm.—*P. G.*

The successful preparation of this ointment depends mainly on the pains taken in incorporating the materials while cooling: to facilitate the process, E. C. Marshall (1875)

recommended the use of an ordinary egg-beater. The ointment should be very white, soft, and perfectly homogeneous. If well made it will retain these properties for some time, but gradually it becomes rancid.

Allied Ointments.—Ceratum Galeni, Cerat de Galien, *F. Cod.* White wax 1 part, expressed oil of almonds 4 parts, distilled rose-water 3 parts. It is prepared in the same manner as cold cream.

Ceratum flavum, Cerat jaune, *F. Cod.* Yellow wax 10 Gm., almond oil 35 Gm., water 25 Gm.

Ceratum laudanisatum, Cerat laudanise, *F. Cod.* Sydenham's laudanum 10 Gm., Galen's cerate 90 Gm.

Uses.—Cold cream, as it is commonly called, is an agreeable and efficient protective in cases of *abrasions*, *ulcers*, *frostbite*, and other superficial lesions of the skin. The addition to it of a small proportion of glycerin, and also of benzoic acid, tends both to preserve the ointment longer and to render it more efficient. As thus modified it is one of the best means of protecting the hands and lips from being chapped.

UNGUENTUM ATROPINÆ, *Br.*—Ointment of Atropine.

Pommade d'atropine, Fr.; *Atropinsalbe*, G.

Preparation.—Take of Atropine 8 grains; Rectified Spirit ½ fluidrachm; Benzoated Lard 1 ounce. Dissolve the atropine in the spirit, add the lard, and mix thoroughly.—*Br.*

Uses.—This preparation is, in most cases, preferable to belladonna ointment, on account of its superior cleanliness and the smaller quantity of it that is efficacious. It is chiefly used in superficial *neuralgiæ*, to relieve other *local pains*, and, applied to the perineum, to allay *urethral* and *rectal* irritation and spasm.

UNGUENTUM BELLADONNÆ, *U. S.*, *Br.*—Belladonna Ointment.

Pomatum cum extracto belladonnæ, F. Cod.; *Pommade belladonée*, Fr.; *Tollkirschensalbe*, G.

Preparation.—Alcoholic Extract of Belladonna-leaves 10 Gm.; Diluted Alcohol 5 Cc.; Benzoinated Lard 85 Gm.; to make 100 Gm. Rub the extract with the diluted alcohol until uniformly soft, then gradually add the lard, and mix thoroughly.—*U. S.*

Each troyounce of the U. S. P. belladonna ointment contains 48 grains of extract of belladonna-leaves, 25 minims of diluted alcohol, and 408 grains of benzoinated lard.

Other pharmacopœias direct—Alcoholic extract of belladonna 50 grains, benzoated lard 1 oz. av.—*Br.* Extract of belladonna 4 Gm., water 2 Gm., lard 24 Gm.—*F. Cod.*

Allied Ointment.—Pomatum populeum, Pommade de bourgeon de peuplier, Onguent populeum, *F. Cod.* Digest the fresh leaves of belladonna, hyoscyamus, black nightshade, and poppy, of each 5 parts, in lard 40 parts; when the moisture has completely evaporated, add poplar-buds 8 parts; digest for a day, express, and strain.

Uses.—Belladonna ointment was originally used in all the cases of *local pain*, *spasm*, etc. to which atropine ointment is now applied, and where cleanliness is not imperative it answers nearly as well. It is better suited than the ointment of the alkaloid for application to absorbing surfaces, as the urethra, vagina, rectum, and ulcerated parts. Associated with astringent ointments (Ung. gallæ), it is a valuable palliative in *prolapsus ani*, especially if applied within the sphincter by means of a small female syringe from which the fenestrated end has been removed.

UNGUENTUM CANTHARIDIS, *Br.*—Ointment of Cantharides.

Unguentum cantharidum, P. G.; *Pomatum cum cantharide*, F. Cod.; *Ung. irritans*, *Ung. ad fonticulos.*—*Pommade épispastique*, Fr.; *Spanischfliegensalbe*, G.

Preparation.—Take of Cantharides, Yellow Wax, of each 1 ounce; Olive Oil 6 fluidounces. Infuse the cantharides in the oil in a covered vessel for twelve hours; then place the vessel in boiling water for fifteen minutes, strain through muslin with strong pressure, add the product to the wax, previously melted, and stir constantly while the mixture cools.—*Br.*

Coarsely-powdered cantharides 3 parts, olive oil 10 parts; digest, express, filter, and to 12 parts of the filtrate add 8 parts of yellow wax.—*P. G.*

The ointment was dismissed from the U. S. P. 1880. Cantharidin being readily soluble in fats, the ointment prepared by digesting cantharides in olive oil has the active

principle more uniformly diffused than by incorporating powdered cantharides with ointment. Cerate of extract of cantharides is well adapted for preparing this ointment extemporaneously; it has a greenish-yellow color.

Allied Ointment.—Unguentum acre. Melt together yellow wax 15 parts, resin 30 parts, turpentine 60 parts, and lard 250 parts; add powdered cantharides 50 parts, and powdered euphorbium 10 parts; mix, and stir until cool—*P. G.* 1872.

The French Codex recognizes a yellow and a green cantharides ointment, of which the former is prepared by infusing cantharides 1 part in melted lard 14 parts, adding a little turmeric, filtering, melting together with yellow wax 2 parts, and adding a little oil of lemon. The green ointment is a mixture of powdered cantharides 1 part, poplar ointment (see Ung. Belladonnæ) 28 parts, and wax 4 parts.

Uses.—Ointment of cantharides is intended to be used as a dressing for recently blistered surfaces, in order to prolong the discharge from them, and also to act as a rubefacient upon the sound skin when blistering is not desirable. In this manner it may sometimes be applied in *muscular rheumatism*, in partial *paralysis*, and in *alopecia*. But in all these cases various stimulant liniments are more suitable. In many cases also for which this ointment is appropriate the plaster of Burgundy pitch with cantharides is much more efficient.

UNGUENTUM CETACEI, *Br.*—Ointment of Spermaceti.

Onguent de blanc de baleine, Fr.; *Walratsalbe*, G.

Preparation.—Melt together Spermaceti 5 oz., White Wax 2 oz., and Almond Oil 1 pint (Imper.); add benzoin in coarse powder ½ oz., and, frequently stirring the mixture, continue the application of heat for two hours; strain the mixture and stir constantly until quite cold.—*Br.*

Except in consistency it resembles spermaceti cerate (p. 434).

Uses.—This ointment, when freshly made, is an appropriate dressing for *wounds*, *excoriations*, and *blisters*.

UNGUENTUM CHRYSAROBINI, *U. S., Br.*—Chrysarobin Ointment.

Pommade de chrysarobine, Fr.; *Chrysarobinsalbe*, G.

Preparation.—Chrysarobin 5 Gm.; Benzoinated Lard 95 Gm.; to make 100 Gm. Mix thoroughly by trituration.—*U. S.*

Each troyounce of the present U. S. P. chrysarobin ointment contains 24 grains of chrysarobin and 456 grains of benzoinated lard, being of one-half the strength of that of 1880.

Melt benzoated lard 480 grains, add chrysarobin 20 grains, and stir them together, maintaining a moderate temperature, so as to promote solution; then stir until cold.—*Br.*

This ointment has been admitted as a more uniform preparation than the *ararobo ointment* originally proposed by Da Silva Lima. Balmano Squire (1877) recommended the solution of chrysarobin in lard to be effected by heating in a water-bath with benzene, and the latter to be evaporated by stirring the liquid in a warm dish while cooling and congealing. The ointment is of a yellow color, and should be entirely free from grittiness, which condition is difficult to obtain, owing to the variable quality of commercial chrysarobin.

Uses.—The various applications of this ointment are described under Chrysarobin.

UNGUENTUM CREOSOTI, *Br.*—Ointment of Creosote.

Pommade créosotée, Fr.; *Kreosotsalbe*, G.

Preparation.—Take of Creosote 1 fluidrachm; Simple Ointment 1 ounce. Mix thoroughly.—*Br.*

Uses.—Creosote ointment is a protective, and, like creosote-water, a wholesome stimulant in numerous cases, including *burns*, *chilblains*, *ulcers* of various descriptions, and especially those which have flabby, fungous granulations, an ichorous secretion, a tendency to gangrene, or a connection with carious bone. Even for *cancerous* ulcers it forms an eligible dressing, especially after they have been washed with creosote-water. Indeed, the applications of the latter, enumerated elsewhere, are, *mutatis mutandis*, those of creosote ointment.

UNGUENTUM DIACHYLON, *U. S., P. G.*—Diachylon Ointment.

Unguentum plumbi Hebræ.—Hebra's lead ointment, E.; *Onguent diachylon*, Fr.; *Diachylonsalbe*, G.

Preparation.—Lead Plaster 500 Gm.; Olive Oil 490 Gm.; Oil of Lavender-flowers 10 Cc.; to make 1000 Gm. Melt together the lead plaster and olive oil at a moderate heat; then, having permitted the mass to become partly cool, incorporate with it the oil of lavender, and stir constantly until cold.—*U. S.*

Each troyounce of diachylon ointment contains 240 grains of lead plaster, 235 grains of olive oil, and 5 drops of oil of lavender-flowers.

Lead plaster 5 parts; free it from glycerin by washing, and from water by heating on a water-bath; melt it at a moderate heat with olive oil 5 parts; stir until cold, and after several hours stir again.—*P. G.*

The decrease of the quantity of lead plaster and corresponding increase of olive oil add very much to the quality and stability of the ointment and bring the two formulas into close harmony.

Uses.—Speaking of the treatment of *eczema*, Hebra said of this ointment, "I have called it *Ung. diachyli*, and prescribed it either alone or in combination with balsam of Peru. It is either applied by means of the finger or rubbed in with balls of charpie from one to three times a day; or, if it be desirable to increase its effect, it may be spread on linen or flannel and applied like a plaster" (*Diseases of the Skin*, Sydenham Soc. ed., ii. 151). This eminent dermatologist recommends the ointment in *fetid sweating* of the feet (*ibid.*, i. 89) and as a part of the treatment of *sycosis menti* (*ibid.*, ii. 317).

UNGUENTUM ELEMI, *Br.*—Ointment of Elemi.

Unguentum (Balsamum) Arcæi, F. Cod.; *Onguent (Baume) d'Arcæus*, Fr.; *Elemisalbe*, G.

Preparation.—Take of Elemi ¼ ounce; Simple Ointment 1 ounce. Melt, strain through flannel, and stir constantly until the ointment solidifies.—*Br.*

Elemi and Venice turpentine, each 15 parts, suet 20 parts, lard 10 parts; melt, strain, and stir until cold.—*F. Cod.*

Uses.—Ointment of elemi is a mild local stimulant, and as such may be used for dressing slightly indolent *ulcers* and for maintaining the suppuration of issues and setons. Formerly an ointment known as *Balsamum Arcæi*, and containing elemi and larch turpentine in equal proportions, was used for the same purpose, and, except in trifling cases, probably with more effect.

UNGUENTUM GALLÆ, *U. S., Br.*—Nutgall Ointment.

Pommade de noix de galle, Fr.; *Galläpfelsalbe*, G.

Preparation.—Nutgall, in No. 80 powder, 20 Gm.; Benzoinated Lard 80 Gm.; to make 100 Gm. Rub the nutgall with the benzoinated lard, gradually added, until they are thoroughly mixed.—*U. S.*

Each troyounce of nutgall ointment contains 96 grains of nutgall and 384 grains of benzoinated lard; the nutgall is preferably passed through a bolting-cloth before adding the lard. The official ointment is twice as strong as that of 1880.

Uses.—Ointment of nutgall, like that of tannic acid, its active constituent, is appropriately applied to relaxed tissues, but especially to those of the *vagina* and *rectum*, to prevent or diminish *prolapsus* of these parts. In the latter case, when *piles* exist, an ointment composed of equal parts of the ointments of nutgall and stramonium and Goulard's cerate is a very efficient remedy.

UNGUENTUM GALLÆ CUM OPIO, *Br.*—Ointment of Galls and Opium.

Preparation.—Take of Ointment of Galls 1 ounce; Opium, in powder, 32 grains. Mix thoroughly.—*Br.*

Uses.—This preparation is intended to fulfil the same indications as those of the compound ointment mentioned under Unguentum Gallæ, but it is far less efficient as applied to the anus, and, owing to the large proportion of opium it contains, not without danger if introduced into the vagina or the rectum.

UNGUENTUM HYDRARGYRI, *U. S., Br., P. A.*—Mercurial Ointment.

Unguentum hydrargyri cinereum, P. G.; *Pomatum cum hydrargyro*, F. Cod.; *Unguentum mercuriale s. neapolitanicum.—Ointment of mercury, Blue ointment*, E.; *Pommade (Onguent) mercurielle à parties égales, P. napolitaine*, Fr.; *Graue Quecksilbersalbe*, G.

Preparation.—Mercury 500 Gm.; Lard 250 Gm.; Suet 230 Gm.; Oleate of Mercury 20 Gm.; to make 1000 Gm. Triturate the oleate of mercury with the mercury, gradually added, in a mortar, until globules of the metal are no longer visible. Then add the lard and suet, previously melted together and partially cooled, and continue the trituration until globules of mercury are no longer visible under a lens magnifying ten diameters. —*U. S.*

Each troyounce of mercurial ointment contains 240 grains of pure mercury, 120 grains of lard, 115 grains of suet, and 5 grains of mercuric oleate.

Mercury, prepared lard, each 1 pound; prepared suet 1 ounce; rub them together until metallic globules cease to be visible.—*Br.*

Mercury and benzoinated lard equal parts. Melt the lard, pour about one-third of it into an iron vessel, and keep it at a temperature so as to remain sufficiently soft; add the mercury very gradually, triturate until extinct, add the remainder of the lard, and continue the trituration until a perfect mixture is obtained.—*F. Cod.*

The German Pharmacopœia has a similar process, but uses lard and mutton-suet in the proportion of 13 : 7, and incorporates with this mixture 10 parts of mercury. This ointment contains one-third its weight of mercury, globules of which should not be visible to the naked eye.

With the exception of the French Codex, the pharmacopœias have very properly discarded *weak mercurial ointment*, leaving the physician to order the dilution of the strong ointment as he may think necessary.

The extinguishment of the mercury, if the directions of the last three formulas are literally followed, requires such a long time that few pharmacists will undertake the trouble of preparing the ointment. The operation is greatly facilitated by the use of mercuric oleate, which is decidedly preferable to tincture of benzoin, sulphur and oil, and other agents formerly employed.

A clean iron mortar is well adapted for the preparation of this ointment on a limited scale, though a small portion of the mercury will superficially combine with the iron. A wedgewood or marble mortar does not occasion even this slight loss.

The extinguishment of the mercury is most readily observed by the use of a lens of moderate power, or by rubbing a small portion of the ointment between folded paper, when no metallic globules should become visible to the naked eye. Rhigini observed that on triturating a little of the ointment in a marble mortar with a wooden pestle until the ointment has been absorbed, the pestle will have a bright metallic surface in case the mercury had not been completely extinguished.

On keeping mercurial ointment at a temperature at which it becomes soft without liquefying, it will slowly alter in composition in such a manner that the lower strata contain a larger proportion of mercury than the upper ones. Hence it is necessary in warm weather to employ fat or a mixture of fats having a higher fusing-point than lard, such as is directed by the U. S. Pharmacopœia.

When made with fresh and sweet fats the ointment contains the mercury in a minutely divided condition. As rancidity commences and increases, a portion of the mercury will be found in chemical combination, and this amount is increased at an elevated temperature. It follows from this that mercurial ointment should be kept in a cool place and in a well-closed jar, and that it may be still further protected by covering the surface of the ointment with paper which has been saturated with tincture of Tolu or tincture of storax.

Uses.—By means of this ointment, duly rubbed upon the skin, the constitutional effects of mercury can be secured without as much risk of disordering the digestion of the patient as when mercury in any of its forms is given by the mouth. It is eliminated by the kidneys and the intestine, but chiefly by the latter, and for months after the inunction has ceased. This was at one time the chief method of treating constitutional and even primary *syphilis*, and, in spite of its being "dirty, laborious, and troublesome," it is better than any other form of mercurial treatment (with the exception, perhaps, of the hypodermic), since "it cures the disease better, and does not damage the constitu-

tion half so much" (Brodie). The inunctions should be made upon different parts of the body successively, as the thighs, the flanks, the arms, the chest, and usually before a fire or in the direct sunlight. Gm. 4–8 (ʒj–ij) should be rubbed in daily; the patient should be clothed in flannel, sleep between blankets, and every two or three days cleanse the skin with a bath of warm water and soap. If he is able he should make the friction with his own hands; and if he cannot do this, the hands of the attendant making them should be protected by a caoutchouc glove or by a pig's bladder previously softened with warm water. In other cases, and especially when mercurial ointment is employed to supplement the internal use of mercurials, it may be spread upon a cloth and applied to a recently blistered surface. In cases of infantile syphilis a flannel roller smeared with the ointment may be secured around the body of the patient. (For further details regarding mercurial inunction in syphilis, typhoid fever, pneumonia, etc., see HYDRARGYRUM.)

All chronic superficial *swellings* resulting from inflammation have their absorption hastened by friction made with mercurial ointment. This treatment is peculiarly appropriate in *glandular* and other enlargements arising from syphilic infection, but it is sometimes also used to promote the resolution of chronic engorgement of the *liver* or *spleen*. *Paronychia* may be prevented from suppurating by frictions with mercurial ointment made every hour for five minutes at a time, while in the intervals the part is kept enveloped in a poultice. In subacute and chronic inflammation of the *joints* much benefit has been derived from wrapping them, previously blistered or not, in cloths spread with mercurial ointment, and keeping them at rest by means of appropriate splints. A like advantage sometimes accrues in chronic or subacute *orchitis* from covering the affected organ in a similar manner. But the simple ointment is less efficacious than that of the iodide of mercury. There can be no doubt that mercury, applied in one form or another to an eruption of *small-pox* upon the face during its papular stage, sometimes prevents the papules from maturing and leaving scars. The ointment may be spread, alone or rendered more tenacious by the admixture of starch, upon linen, with suitable apertures for the nostrils and mouth, and closely applied to the face like a mask. It has been used after the same manner in the treatment of *erysipelas* of the face, but, on the whole, without advantage, and frequently with the effect of causing salivation. It is also a palliative of *prurigo pudendi*, but in this case it is open to the same objection. Unna recommends for common *warts* and *condylomata acuminata* the continuous application of mercurial ointment containing 5 per cent. of arsenic. This dressing is said not to irritate the part, but to cause the warts to wither (*Boston Med. and Surg. Jour.*, Oct. 1882, p. 321).

UNGUENTUM HYDRARGYRI AMMONATI, *U. S.*, *Br.*—OINTMENT OF AMMONIATED MERCURY.

Unguentum hydrargyri album, P. G.—*Ointment of white precipitate*, E.; *Pommade de mercure précipité blanc*, Fr.; *Weisse Quecksilbersalbe*, G.

Preparation.—Ammoniated Mercury, in very fine powder, 10 Gm.; Benzoinated Lard 90 Gm.; to make 100 Gm. Rub the ammoniated mercury with the benzoinated lard, gradually added, until they are thoroughly mixed.—*U. S.*

Each troyounce of the ointment contains 48 grains of ammoniated mercury and 432 grains of the base.

Ammoniated mercury 50 grains; simple ointment 450 grains.—*Br.* Ammoniated mercury 1 part; paraffin ointment 9 parts.—*P. G.*

Uses.—Ointment of ammoniated mercury is used as a stimulant in cases of chronic *blepharitis* and in several cutaneous affections, especially in *psoriasis* of limited extent, and in those of parasitic origin, including *ringworm* of the scalp (porrigo scutulata). In *herpes circinatus*, *sycosis*, and *pityriasis* it is also employed. In *herpes zoster* it has been reported, on insufficient grounds, to be useful. It is more efficacious in chronic forms of circumscribed *eczema* and of tubercular and squamous *syphilis*. Like other mercurial ointments, it is a destroyer of *lice*. The following may be used instead: R. Hydrarg. ammoniat., gr. xxxv; balsam Peruviani, ʒj; ol. petrolei, ʒiiss; lanolini ad ʒviij.—M. (Whitlaw). Ointment of ammoniated mercury has over the others the advantage of cleanliness, and it may be perfumed with some agreeable essential oil, such as lavender or bergamot.

UNGUENTUM HYDRARGYRI COMPOSITUM, *Br.*—Compound Ointment of Mercury.

Pommade mercurielle composée, Fr.; *Kampfer-Quecksilbersalbe*, G.

Preparation.—Take of Ointment of Mercury 6 ounces; Yellow Wax, Olive Oil, each 3 ounces; Camphor 1½ ounces. Melt the wax with a gentle heat, and add the oil; then, when the mixture is nearly cold, add the camphor in powder and the ointment of mercury, and mix the whole thoroughly together.—*Br.*

The ointment has a greenish tint, and is softened by the camphor.

Uses.—It is impossible to discover any sufficient reason for the existence of this preparation, which probably has the virtues, and no others, of simple mercurial ointment.

UNGUENTUM HYDRARGYRI IODIDI RUBRI, *Br.*—Ointment of Red Iodide of Mercury.

Pommade d'iodure mercurique, Fr.; *Jodquecksilbersalbe*, G.

Preparation.—Take of Red Iodide of Mercury, in fine powder, 16 grains; Simple Ointment 1 ounce. Mix thoroughly.—*Br.*

Uses.—This ointment is chiefly used as a stimulant of indolent *scrofulous* and *syphilitic ulcers* and scrofulous *glandular swellings*. In India *goitre* has been cured in many thousands of cases by rubbing into the tumor an ointment made with 60 grains of red iodide of mercury to a pound of lard, and then exposing the patient for several hours to the direct action of the sun. The operation is repeated twice a day for several days, the applied ointment being allowed to remain (Macnamara, *Dublin Quart. Jour.*, Nov. 1857, p. 500). A very similar method has been employed with remarkable success in the treatment of enlargement of the *liver* and *spleen*, the heat of a fire being substituted for that of the sun.

UNGUENTUM HYDRARGYRI NITRATIS, *U. S., Br.*—Ointment of Nitrate of Mercury.

Pomatum citrinum, F. Cod.; *Unguentum hydrargyri citrinum*, *Unguentum citrinum*.—*Citrine ointment*, E.; *Pommade citrine*, *Onguent citrin*, Fr.; *Quecksilbernitratsalbe*, G.

Preparation.—Mercury 70 Gm.; Nitric Acid 175 Gm.; Lard Oil 760 Gm. Heat the lard oil in a glass or porcelain vessel to a temperature of 100° C. (212° F.); then withdraw the heat, gradually add 70 Gm. of nitric acid, and, when the reaction moderates, reapply the heat until effervescence ceases. Then allow the mixture to cool to about 40° C. (104° F.). Having dissolved the mercury in the remainder of the nitric acid with the aid of sufficient heat to prevent the solution from crystallizing, add this solution to the mixture. When the mass has become entirely cold, mix it thoroughly by trituration, avoiding the use of an iron spatula.—*U. S.*

To make 4 av. ozs. of citrine ointment use 123 grains of mercury, 306 grains of nitric acid, and 1330 grains of lard oil: 123 grains of the acid are used for treatment of the lard oil, and the remainder for the solution of the mercury. It is important that the nitric acid should be of official strength, and that the oxidation of the fat be completed before the addition of the mercurial solution, so as to avoid reduction of the mercurial salt, and consequent discoloration. When carefully made the ointment is of a bright lemon-yellow color and keeps well, gradually, however, darkening somewhat in color.

Take of mercury, by weight, 4 ounces; nitric acid 12 fluidounces; prepared lard 15 ounces; olive oil 32 fluidounces. Dissolve the mercury in the nitric acid with the aid of a gentle heat; melt the lard in the oil, by a steam- or water-bath, in a porcelain vessel capable of holding six times the quantity, and, while the mixture is at about 100° C., add the solution of mercury, also at about the same temperature, mixing them thoroughly. If the mixture do not froth up, increase the heat till it occurs. Keep it stirred until it is cold.—*Br.*

On mixing melted fats with a solution of mercuric nitrate containing free nitric acid, a very complicated reaction takes place, resulting, on the one hand, in the oxidation of the fat and the evolution of nitric oxide (nitrogen dioxide) and nitrogen tetroxide, and, on the other hand, in the conversion by the latter of the olein contained in the fat into solid elaidin. The products of oxidation of the fat contain various volatile fatty acids, but must necessarily vary with the nature of the fat, the amount of free nitric acid, and the degree of the heat. Should the nitric acid be insufficient in

quantity or the temperature rise to too high a degree, the oxidation is effected in part at the expense of the mercuric nitrate, which is thereby reduced to mercurous salt. The B. P. formula orders a much larger quantity of nitric acid than is necessary, and indicates about 100° C. as the temperature at which the fat should be mixed with the mercuric solution. According to the temperature at which the nitric acid acts upon the mercury, the solution will contain mercurous or mercuric nitrate, or both salts, with or without hyponitric acid. If free from mercurous nitrate, the solution will yield with lard at 200° F. a citrine ointment having, at least at first, a bright-yellow color. In our experience an equally good and permanent ointment is obtained by heating both the mercuric solution and the fat to about 70° C. (158° F.) before mixing them; and even a lower degree of heat, about 50° C. (122° F.), will produce good results if the reaction is completed before the ointment is permitted to cool. All difficulties are, however, overcome by following the process adopted by the U. S. P. Unsalted butter and many other fats, the drying oils excepted, similarly treated, will yield an equally handsome ointment. The French Codex directs 1 part of mercury and 2 parts of nitric acid to 20 parts of fat composed of equal weights of lard and olive oil; this salve is firm, and is sold in the form of square cakes.

Citrine ointment should be prepared in glass or porcelain vessels, and should not be brought into contact with iron or other metal.

Allied Ointment.—Unguentum nitricum, Ung. oxygenatum, *P. G.* 1872. Melt 50 parts of lard, add 3 parts of nitric acid spec. grav. 1.185, and heat slowly and with constant stirring until the reaction ceases; then pour into paper moulds (see page 432). It is of a light-yellow color.

Unguentum hydrargyri nitratis dilutum, *Br.* Mix nitrate-of-mercury ointment 1 ounce with soft paraffin 2 ounces.

Uses.—Ointment of mercuric nitrate is employed in nearly all of the cases mentioned under the head of ointment of ammoniated mercury, but especially in chronic diseases of the *skin*, and in the affections enumerated under ointment of red oxide of mercury. It is more stimulating than the former preparation, and generally needs dilution with lard. It is very apt to occasion salivation.

UNGUENTUM HYDRARGYRI OXIDI FLAVI, *U. S.*—Ointment of Yellow Mercuric Oxide.

Pommade d'oxyde jaune de mercure, Fr.; *Gelbe Quecksilberoxydsalbe*, G.

Preparation.—Yellow mercuric oxide, in very fine powder, 10 Gm.; Ointment 90 Gm.; to make 100 Gm. Rub the oxide of mercury with the ointment, gradually added, until they are thoroughly mixed.—*U. S.*

Each troyounce of the ointment contains 48 grains of yellow mercuric oxide and 432 grains of simple ointment.

Yellow oxide of mercury 1 part, petrolatum 15 parts.—*F. Cod.*

The yellow wax contained in the simple ointment will protect this preparation from rancidity, but it is best to keep the ointment on hand for a short time only or to prepare it when needed.

Uses.—This preparation was introduced as a substitute for ointment of the red oxide of mercury, with which it is identical in its medicinal qualities; but owing to the amorphous condition and the greater fineness of subdivision of the particles of the oxide from which it is made, it appears to be more suitable for application to the *eye* and other delicate tissues.

UNGUENTUM HYDRARGYRI OXIDI RUBRI, *U. S., Br.*—Ointment of Red Mercuric Oxide.

Unguentum hydrargyri rubrum, P. G.; *Pomatum cum oxydo-hydrargyrico*, F. Cod.; *Ung. precipitatum rubrum.—Pommade d'oxyde rouge de mercure, Pommade de Lyon, Baume ophthalmique rouge*, Fr.; *Rothe Quecksilbersalbe*, G.

Preparation.—Red Mercuric Oxide, in very fine powder, 10 Gm.; Castor Oil 5 Gm.; Ointment 85 Gm.; to make 100 Gm. Triturate the red mercuric oxide with the castor oil until a perfectly smooth mixture results; then gradually incorporate the ointment and mix thoroughly.—*U. S.*

Each troyounce of the ointment contains 48 grains of red mercuric oxide, 24 grains of castor oil, and 408 grains of simple ointment.

Take of red oxide of mercury, in very fine powder, 62 grains; hard paraffin ¼ ounce;

soft paraffin ¾ ounce. Melt the hard and soft paraffins together, and when the mixture in cooling begins to thicken add the oxide of mercury in a glass or porcelain mortar, and mix the whole thoroughly.—*Br.*

Red oxide of mercury 1 part, petrolatum 15 parts, *F. Cod.* (paraffin ointment 9 parts, *P. G.*).

The reduction of red mercuric oxide to a very fine powder is materially facilitated by trituration with alcohol, which also changes the color from bright scarlet to a deep orange. If kept on hand for some time, the ointment is apt to become rancid and discolored: this can be entirely prevented by using a mixture of yellow wax and castor oil, suggested by J. B. Baxley, as follows: Melt together 108 grains of yellow wax and 324 grains of castor oil, and when the mixture begins to cool add 48 grains of finely powdered red mercuric oxide, and incorporate thoroughly.

Allied Ointments.—Unguentum ophthalmicum, *P. G.* 1872. Melt together 30 parts of expressed oil of almond and 19 parts of yellow wax, and mix these intimately with 1 part of very finely-levigated oxide of mercury.

Unguentum ophthalmicum compositum, s. Ung. ophthalmicum St. Yves, *P. G.* 1872. Melt together lard 140 parts, and yellow wax 24 parts; add red oxide of mercury 15 parts and pure oxide of zinc 6 parts, and mix thoroughly with camphor 5 parts, previously dissolved in expressed oil of almond 10 parts.

Pomatum de Regent; Pommade de Régent, *F. Cod.*—Red oxide of mercury 1 Gm.; lead acetate 1 Gm.; camphor 0.10 Gm.; petrolatum 18 Gm.

Uses.—This ointment when used as a dressing for *ulcers* is very apt to produce the specific effects of mercury upon the system. It should not, therefore, be too freely applied nor upon too large a surface at once. Its use is very much restricted to the treatment of indolent *syphilitic sores* and chronic inflammation of the edges of the eyelids (*blepharitis*). For the latter purpose the ointment should be diluted. 1 part of ointment of red oxide of mercury to 8 or 10 of simple ointment is usually strong enough. An ointment made with red oxide of mercury 1½ gr. and lanoline or vaseline ʒss has been recommended to abort *furuncles* and as a palliative of *acne*.

UNGUENTUM HYDRARGYRI SUBCHLORIDI, *Br.*—Ointment of Subchloride of Mercury.

Unguentum calomelanos.—Pommade de chlorure mercureux, *P. de calomel*, Fr.; *Quecksilberchloriirsalbe*, G.

Preparation.—Take of Subchloride of Mercury 80 grains; Benzoated Lard 1 ounce. Mix thoroughly.—*Br.*

Calomel 1 part, benzoinated lard 9 parts.—*F. Cod.* This ointment, being known in France also as *pommade au précipité blanc*, should not be confounded with the ointment of ammoniated mercury. (See pp. 826 and 846.)

Uses.—Calomel ointment has the advantage over all the ointments made with salts of mercury of being wholly unirritating, and over simple mercurial ointment of not discoloring the skin or staining the clothing. It is therefore adapted to the local treatment of *cutaneous eruptions* of limited extent, and especially to those of a *syphilitic* nature. It is conveniently associated with white precipitate ointment in the affections to which that ointment is applied.

UNGUENTUM IODI, *U. S., Br.*—Iodine Ointment.

Unguentum iodinii.—Pommade d'iode, Fr.; *Jodsalbe*, G.

Preparation.—Iodine 4 Gm.; Potassium Iodide 1 Gm.; Water 2 Cc.; Benzoinated Lard 93 Gm.; to make 100 Gm. Rub the iodine and potassium iodide first with the water, and then with the benzoinated lard, gradually added, until they are thoroughly mixed, avoiding the use of an iron spatula.—*U. S.*

Each troyounce of iodine ointment contains 20 grains of iodine, 5 grains of potassium iodide, 12 minims of water, and 445 grains of benzoinated lard.

Iodine and potassium iodide each 32 grains; glycerin 1 fluidrachm; prepared lard 2 oz. av.—*Br.*

The water and potassium iodide are serviceable for effecting the fine division of the iodine. The lard should be added at first in very small quantities, and the trituration continued until the solid ingredients are perfectly levigated and the mixture is entirely free from grittiness and uniform in color.

Allied Ointment.—Unguentum iodinii compositum, *U. S.* 1870; Pomatum cum iodureto potassico iodurato, *F. Cod.*; Compound iodine ointment, *E.*; Pommade d'iodure de potassium ioduré, *Fr.*; Jodkaliumsalbe mit Jod, *G.*—Iodine 15 grains; potassium iodide 30 grains; water 30 minims; lard a troyounce.—*U. S.* 1870. Iodine 2, potassium iodide 10, water 10, and benzoinated lard 80 parts.—*F. Cod.*

Uses.—Iodine ointment has been employed extensively to promote the absorption of the exudation occurring in local inflammations. It is used in indolent enlargement of the *tonsils*, the *thyroid*, and the *lymphatic glands*; also in *hydrarthrosis*, *cold abscess*, and chronic *peritonitis*. It may be applied to the *mamma* when abscess threatens to form in that gland, to promote the absorption of *pleural* and *pericardial effusions*, to prevent the development of inflammation in *tendinous sheaths*, and that of *chilblains*, etc.

Compound iodine ointment (*U. S.* 1870), it will be observed, contained less iodine than the simple ointment. The advantage of the potassium iodide in it, if any, must have depended upon the absorption of the salt, which could not be great from the limited surfaces to which the ointment is usually applied. The compound and the simple ointments are used in the same affections.

UNGUENTUM IODOFORMI, *U. S., Br.*—Iodoform Ointment.

Pommade d'iodoforme, Fr.; *Jodoformsalbe*, G.

Preparation.—Iodoform, in very fine powder, 10 Gm.; Benzoinated Lard, 90 Gm.; to make 100 Gm. Rub the iodoform with the benzoinated lard, gradually added, until they are thoroughly mixed.—*U. S.*

Each troyounce of the ointment contains 48 grains of iodoform and 432 grains of benzoinated lard. An impalpable powder of iodoform is readily obtained by trituration with alcohol.

Dissolve iodoform 1 ounce in melted benzoated lard 9 ounces, and cool.—*Br.*

The ointment should be perfectly smooth and free from grittiness; it has a light-yellow color and the peculiar odor of iodoform. (For disguising the odor consult pp. 879, 885.)

Allied Preparation.—Crayons d'iodoforme, *F. Cod.*; Iodoform pencils. Triturate iodoform 20 parts with powdered acacia 1 part, and by means of very little water and glycerin form a mass of pilular consistence which is rolled out into cylinders of suitable size.—*F. Cod.* Butter of cacao may be used with an equal weight of iodoform; these pencils are dusted with lycopodium.

Uses.—Under Iodoform the numerous applications of this ointment have been mentioned. It is anæsthetic and stimulant.

UNGUENTUM PICIS LIQUIDÆ, *U. S., Br.*—Tar Ointment.

Pomatum cum pice, F. Cod.—*Pommade de goudron*, Fr.; *Theersalbe*, G.

Preparation.—Tar 500 Gm.; Yellow Wax 125 Gm.; Lard 375 Gm.; to make 1000 Gm. Melt together the yellow wax and the lard at a moderate heat. Then incorporate the tar, strain the mixture through muslin, and stir the ointment until it is cool. —*U. S.*

Each troyounce of tar ointment contains 240 grains of tar, 60 grains of yellow wax, and 180 grains of lard.

Tar 5 ounces; yellow wax 2 ounces; melt the wax with a gentle heat, add the tar, and stir the mixture briskly while it cools.—*Br.*

Tar 1 part, lard 9 parts; mix.—*F. Cod.*

The substitution of wax and lard for the suet of the 1880 formula will prove a desirable change; the ointment as now made is far less liable to be granular than formerly.

Allied Ointments.—Unguentum picis betulæ, s. U. rusci, Wolff's tar ointment. Birch tar (see p. 1255) 8 Gm., simple ointment 42 Gm.

Unguentum picis compositum, *N. F.*, Compound tar ointment.—Melt together, at a gentle heat, 26 parts of yellow wax, 32 parts of lard, and 35 parts of cotton-seed oil; add 2 parts of tincture of benzoin, and continue heating until the alcohol has evaporated. Remove the heat, add 4 parts of oil of tar and 3 parts of zinc oxide, and incorporate thoroughly by stirring until cool.

Uses.—Tar ointment will sometimes cure *scabies*, but its action is uncertain and dilatory. In scaly eruptions, as *psoriasis* and *lepra*, its efficacy is much more decided, as well as in *chronic eczema* after the liquid secretion has ceased. In *ringworm* and in *prurigo* it is one of the best applications, and it may be used with advantage in the greater number of indolent and gangrenous *ulcers*.

UNGUENTUM PLUMBI ACETATIS, *Br.*—Ointment of Lead Acetate.

Preparation.—Take of Lead Acetate, in fine powder, 12 grains; Benzoated Lard 1 oz. av. Mix thoroughly.—*Br.*

Allied Ointments.—Unguentum narcotico-balsamicum Hellmundi, Hellmund's ointment. Triturate together lead acetate 10 parts and extract of conium 30 parts; add gradually simple ointment 240 parts, balsam of Peru 30 parts, and wine of opium (with saffron) 5 parts, and mix thoroughly.—*P. G.* 1872.

Unguentum plumbi tannici (see page 1264).

Uses.—The action and uses of lead acetate ointment are probably identical with those of the cerate of lead subacetate. It is applied as a dressing to *wounds*, *excoriations*, and *inflamed surfaces* generally.

UNGUENTUM PLUMBI CARBONATIS, *U. S., Br.*—Ointment of Lead Carbonate.

Pomatum cum carbonate plumbico, F. Cod.; *Unguentum cerussæ, s. Ung. album simplex*, P. G., P. A.—*Pommade de carbonate de plomb, Onguent blanc de Rhazes*, Fr.; *Bleiweissalbe*, G.

Preparation.—Lead Carbonate, in very fine powder, 10 Gm.; Benzoinated Lard 90 Gm.; to make 100 Gm. Rub the lead carbonate with the benzoinated lard, gradually added, until they are thoroughly mixed.—*U. S.*

Each troyounce of this ointment contains 48 grains of lead carbonate and 432 grains of benzoinated lard.

Other pharmacopœias direct—Lead carbonate 62 grains; simple ointment 1 oz. av.—*Br.* Lead carbonate 1 part; benzoinated lard 5 parts.—*F. Cod.* Lead carbonate 3 parts; paraffin ointment 7 parts.—*P. G.*

Allied Ointment.—Unguentum cerussæ camphoratum. Ointment of lead carbonate 95 parts, powdered camphor 5 parts.—*P. G.*

Uses.—It is used for the same purposes as the last-mentioned ointment, from which it perhaps differs in being less astringent. It forms a suitable dressing for recent *burns* of the first degree. The danger of poisoning by the absorption of the lead it contains is an objection to its prolonged use.

UNGUENTUM PLUMBI IODIDI, *U. S., Br.*—Ointment of Lead Iodide.

Pomatum cum iodureto-plumbico, F. Cod.; *Pommade d'iodure de plomb*, Fr.; *Jodbleisalbe*, G.

Preparation.—Lead Iodide, in very fine powder, 10 Gm.; Benzoinated Lard 90 Gm.; to make 100 Gm. Rub the lead iodide with the benzoinated lard, gradually added, until they are thoroughly mixed.—*U. S., F. Cod.*

Each troyounce of the ointment contains 48 grains of lead iodide and 432 grains of benzoinated lard.

Lead iodide, in fine powder, 62 grains; simple ointment 1 oz. av.; mix thoroughly.—*Br.*

Uses.—The discutient influence of this ointment upon *enlarged glands* of the lymphatic system, and even upon certain *mammary tumors* of uncertain nature, is sometimes very distinctly marked. In chronic enlargement of the *testicle* following gonorrhœa it is often of palpable use. It has also been applied to some local *cutaneous eruptions*, but without demonstrable advantage.

UNGUENTUM POTASSÆ SULPHURATÆ, *Br.*—Ointment of Sulphurated Potash.

Pommade de foie de soufre, Fr.; *Schwefellebersalbe*, G.

Preparation.—Take of Sulphurated Potash 30 grains; Hard Paraffin ¼ ounce; Soft Paraffin ¾ ounce. Triturate the sulphurated potash in a glass or porcelain mortar, and gradually add the melted mixture of paraffins, rubbing them together until the ointment is perfectly smooth and free from grittiness. This ointment should be recently prepared. —*Br.*

Uses.—Sulphurated potash ointment is only used in the treatment of *scabies*, for which it is an efficient remedy.

UNGUENTUM POTASSII IODIDI, *U. S.*, *Br.*—Ointment of Potassium Iodide.

Unguentum kalii iodati, P. G.; *Pomatum cum iodureto potassico*, F. Cod.; *Pommade d'iodure de potassium*, Fr.; *Jodkaliumsalbe*, G.

Preparation.—Potassium Iodide, in fine powder, 12 Gm.; Sodium Thiosulphate (Hyposulphite) 1 part; Water, hot, 10 Cc.; Benzoinated Lard, 77 Gm.; to make 100 Gm. Dissolve the potassium iodide and the sodium thiosulphate in the hot water; then gradually add the benzoinated lard, and mix thoroughly.—*U. S.*

Each troyounce of the ointment contains 58 grains of potassium iodide, 5 grains of sodium thiosulphate, 50 minims of hot water, and 370 grains of benzoinated lard.

Potassium iodide 64 grains; potassium carbonate 4 grains; distilled water 1 fluidrachm; benzoated lard 1 oz. av.—*Br.* Potassium iodide 10 parts, water 10 parts, benzoinated lard 80 parts.—*F. Cod.* Potassium iodide 20 parts, sodium thiosulphate ¼ part, water 15 parts, lard 165 parts.—*P. G.*

The addition of sodium thiosulphate is made for the purpose of preventing the liberation of free iodine and the gradual change of the color of the ointment from white to yellow and brown. Iodine added to this ointment will likewise be decolorized, with the formation of sodium iodide. (See Sodii Hyposulphis.) The addition of a little potassium carbonate, as directed by the Br. P., or of a few drops of potassa or soda solution, will likewise preserve the white color of the ointment.

Uses.—The discutient powers of this ointment are certainly inferior to those of the ointments of iodine; its only advantages consist in its being colorless and in not staining the linen. It is used to promote the reduction of *enlarged glands*.

UNGUENTUM STRAMONII, *U. S.*—Stramonium Ointment.

Pommade de stramoine, Fr.; *Stechapfelsalbe*, G.

Preparation.—Extract of Stramonium-seed 10 Gm.; Diluted Alcohol, 5 Cc.; Benzoinated Lard 85 Gm.; to make 100 Gm. Rub the extract with the diluted alcohol until uniformly soft, then gradually add the benzoinated lard, and mix thoroughly.—*U. S.*

Each troyounce of the ointment contains 48 grains of extract of stramonium-seed, 28 minims of diluted alcohol, and 408 grains of benzoinated lard.

Uses.—Stramonium ointment, although less efficient than belladonna ointment, may be used for the same purposes—viz. to allay *pain* and relieve *spasm*. It has been found to palliate the suffering caused by open *cancer* of the breast, and it affords much comfort in cancer of the *rectum*, *piles*, fissures and prolapsus of the *anus*, etc. An ointment composed of equal parts of stramonium ointment, ointment of galls, and cerate of lead subacetate is very useful in these affections, and also to arrest the itching caused by vermicular *ascarides*.

UNGUENTUM SULPHURIS, *U. S.*, *Br.*—Sulphur Ointment.

Pomatum sulfuratum, F. Cod., P. A.; *Unguentum sulfuratum simplex.—Pommade soufrée*, Fr.; *Schwefelsalbe*, G.

Preparation.—Washed Sulphur 300 Gm.; Benzoinated Lard 700 Gm.; to make 100 Gm. Rub the sulphur with the benzoinated lard, gradually added, until they are thoroughly mixed.—*U. S.*

Each troyounce of the ointment contains 144 grains of washed sulphur and 336 grains of benzoinated lard.

Sublimed sulphur 1 ounce; benzoated lard 4 ounces.—*Br.* Washed sulphur 10 parts, almond oil 10 parts, benzoinated lard 80 parts.—*F. Cod.*

We fail to see any advantage in the substitution of washed sulphur for sublimed sulphur, as formerly directed: the purposes for which sulphur ointment is used, as an antiparasitic, would seem to point in favor of sulphur containing some free acid.

Allied Ointments.—Unguentum sulfuratum compositum. Mix 1 part each of sublimed sulphur and powdered zinc sulphate with 8 parts of lard.—*P. G.* 1872.

Unguentum sulphuris alkalinum. Alkaline sulphur ointment *E.*; Helmerich's Salbe. *G.*—Washed sulphur 20 parts; potassium carbonate 10 parts; water 5 parts; benzoinated lard 65 parts; to make 100 parts. Rub the sulphur with the potassium carbonate and the water, gradually add the benzoinated lard, and mix thoroughly.—*U. S.* 1880. Potassium carbonate

5 Gm., water 5 Gm., sulphur 10 Gm., expressed almond oil 5 Gm.; lard 35 Gm. Mix in the order stated.—*F. Cod.*

Unguentum sulphuris compositum, *N. F.*; Compound sulphur ointment, Wilkinson's ointment, Hebra's itch ointment.—Mix 15 parts of oil of cade with 30 parts each of lard and green soap; then gradually incorporate 15 parts of sublimed sulphur and 10 parts of precipitated calcium carbonate.

Uses.—The chief use of sulphur ointment is in the treatment of *scabies*. The modes of using it and the conditions of its success have been described under Sulphur.

UNGUENTUM SULPHURIS IODIDI, *Br.*—Ointment of Iodide of Sulphur.

Pommade d'iodure de soufre, Fr.; *Jodschwefelsalbe*, G.

Preparation.—Take of Sulphur Iodide 30 grains; Hard Paraffin ¼ oz.; Soft Paraffin ¾ oz. Triturate the sulphur iodide in a glass or porcelain mortar, and gradually add the melted mixture of paraffins, rubbing them together until the ointment is perfectly smooth and free from grittiness.—*Br.*

Uses.—Its tendency to speedy decomposition renders this ointment practically of little value, even in the treatment of limited chronic eruptions of *eczema*, *lepra*, and *acne*, and of *lupus*.

UNGUENTUM TEREBINTHINÆ, *Br., P. G.*—Ointment of Turpentine.

Onguent térébenthiné, Fr.; *Terpentinsalbe*, G.

Preparation.—Take of Oil of Turpentine 1 fluidounce; Resin, in coarse powder, 54 grains; Yellow Wax, Prepared Lard, each ½ ounce. Melt these ingredients together by the heat of a steam or water-bath. Remove the vessel, and stir the mixture constantly while it cools.—*Br.*

Melt turpentine and yellow wax, of each 1 part, and add oil of turpentine 1 part.—*P. G.*

Unguentum digestivum simplex, *F. Cod.*—Onguent digestif simple, *Fr.*—Triturate Venice turpentine 40 parts with yelk of egg 20 parts, and add olive oil 10 parts.

Uses.—This ointment has the same virtues as the compound resin cerate, but, being softer, is more convenient for application to *burns*, *erysipelas*, *erythema*, and other recent local inflammations of the skin.

UNGUENTUM VERATRINÆ, *U. S., Br.*—Veratrine Ointment.

Unguentum veratriæ, Br.—*Veratria ointment*, E.; *Pommade de vératrine*, Fr.; *Veratrinsalbe*, G.

Preparation.—Veratrine 4 Gm.; Olive Oil 6 Gm.; Benzoinated Lard 90 Gm. Rub the veratrine with the olive oil in a mortar; then gradually add the benzoinated lard, and mix thoroughly.—*U. S.*

Each troyounce of the ointment contains 20 grains of veratrine, 30 grains (34 minims) of olive oil, and 430 grains of benzoinated lard.

Rub together veratrine 8 grains and olive oil 1 fluidrachm; melt hard paraffin ¼ ounce and soft paraffin ¾ ounce, and mix the whole thoroughly in a mortar until cold.—*Br.*

To prevent annoyance from the dust arising during the trituration of dry veratrine, the alkaloid should be previously covered with a small quantity of olive oil, as directed in the first formula.

Uses.—The American is more than twice as strong as the British ointment. (For an account of its uses see Veratrina.)

UNGUENTUM ZINCI OXIDI, *U. S.*—Ointment of Zinc Oxide.

Unguentum zinci, Br., P. G.; *Unguentum de nihilo albo.—Pommade d'oxyde de zinc*, Fr.; *Zinksalbe*, G.

Preparation.—Zinc oxide 200 Gm.; Benzoinated Lard 800 Gm.; to make 1000 Gm. Sift the zinc oxide, through a No. 20 sieve, upon the surface of the benzoinated lard, previously melted, and incorporate it by stirring, which is to be continued until the ointment is cool.—*U. S.*

Each troyounce of the ointment contains 96 grains of zinc oxide and 384 grains of benzoinated lard.

Other pharmacopœias direct—Zinc oxide 80 grains, benzoinated lard 1 oz. av.—*Br.* Zinc oxide 1 part, benzoinated lard (lard, *P. G.*) 9 parts.—*F. Cod.*

Since zinc ointment is frequently applied to very tender excoriated surfaces, it is of great importance that it should be entirely free from lumps and gritty particles, and for this reason we should prefer to sift the zinc oxide through fine bolting-cloth, instead of the No. 20 sieve directed above. On keeping, the ointment gradually acquires a tough consistence.

Allied Preparations.—Unguentum zinci oleati, *Br.* Oleate of zinc 1 oz.; soft paraffin 1 oz. Unguentum calaminæ, *Br.* (Turner's cerate). Prepared calamine 1 oz.; benzoated lard 5 oz. Ceratum zinci carbonatis, *U. S.* 1870. Precipitated zinc carbonate 1 oz.; simple ointment 5 oz.

Uses.—Zinc oxide ointment is a protective, astringent, and mildly stimulant application, adapted to *ulcers* which are irritable, have loose granulations, and discharge pus copiously. It is especially useful as a dressing for *fissures* of the nipple and anus; for local eruptions of *eczema*, *herpes*, and *impetigo;* for all cases of simple *abrasion* or *ulceration*, including blistered surfaces, after their active inflammation has subsided; for *ophthalmia tarsi*, etc. The cerate, which is no longer officinal, was employed in similar affections.

UREA.—Urea.

Carbamide.—Urée, Fr.; *Harnstoff*, G.

Formula $CH_4N_2O = CO(NH_2)_2$. Molecular weight 59.95.

Origin.—Urea was discovered in urine by Rouelle (1773), and, in the impure condition in which he obtained it, designated as *extrait savonneux de l'urine*. Fourcroy and Vauquelin (1799) prepared it in the pure state. It has been found in the urine of mammals, more particularly in that of the Carnivora, in the urine of birds and other animals, and in many animal fluids. Human urine contains from 2 to 4 per cent. of urea. The transformation into urea of ammonium cyanate by evaporating its aqueous solution, as observed by Wöhler (1828), was the first instance in which an organic compound produced in the living organism was artificially formed. Urea has also been artificially prepared from other cyanogen compounds.

Preparation.—Urine is evaporated to a syrupy consistence, allowed to cool, and the residue mixed with an equal volume of nitric acid. The nitrate of urea, which crystallizes in scales and prisms, is purified by washing with cold water and by recrystallization, and is then decomposed by boiling with water and barium carbonate; the filtrate is evaporated and the residue exhausted with alcohol. Oxalic acid and calcium carbonate may be substituted in this process for nitric acid and barium carbonate.

Properties.—Urea crystallizes in colorless and inodorous four-sided prisms, which have a cooling saline taste and are permanent in dry air. It melts near 120° C. (248° F.), and at a higher heat is decomposed, giving off ammonia and leaving cyanuric acid, which at a still higher temperature yields cyanic acid. Urea dissolves in its own weight of cold water, is readily soluble in alcohol, but is slightly soluble in pure ether. In contact with nitrogen trioxide urea is decomposed into carbon dioxide, nitrogen, and water. A similar decomposition is effected by an acidulated solution of potassium permanganate. Dissolved in pure water, urea keeps unchanged for a long time, but in the presence of putrefiable matter it is rapidly decomposed, yielding ammonia and carbon dioxide; hence foul urine contains no urea.

Urea forms crystallizable compounds with acids, with metallic oxides, and with many neutral salts. *Urea hydrochlorate* is very deliquescent. *Urea nitrate*, $CH_4N_2O.HNO_3$, is slightly soluble in cold water and alcohol and nearly insoluble in nitric acid; it contains 48.78 per cent. of urea. *Urea oxalate*, $(CH_4N_2O)_2.H_2C_2O_4$, crystallizes in scales which dissolve at 15° C. (59° F.) in 23 parts of water, but require a much larger quantity of solution of oxalic acid; it contains 57.14 per cent. of urea. The amount of urea in urine is frequently determined by forming the compound either with nitric or oxalic acid.

Allied Compound.—Formamide, $CH_3NO = CHO.NH_2$. It is produced on the dry distillation of ammonium formate or heating a mixture of this salt and of urea to about 140° C. (284° F.), on heating ethylformate and ammonia, and by various other processes. It is a colorless oily liquid, which in vacuo distils without decomposition below 150° C. (302° F.), and which is soluble in water and alcohol in all proportions, but is insoluble in ether. Mercuric Formamide, Hydrargyrum formamidatum, has been used hypodermically.

Action and Uses.—More than half a century ago it was demonstrated by Ségalas that urea injected into the veins of animals increased notably the discharge of urine, with a greatly augmented proportion of urea, and, much more recently, Wöhler and Frerichs alleged that when introduced into an animal's stomach it reappeared almost entirely in the urine. Gallois, however, proved that only two-thirds at most of the urea thus administered was recoverable from the urine, and also that in very large doses, such as 300 grains, given to a rabbit, it occasioned prostration, trembling, convulsions, and death. Similar large doses injected into the veins or hypodermically produced the same effects, and non-lethal quantities of urea occasioned deep coma, paroxysmal spasms, hurried respiration, trembling, injection of the capillary vessels, and frequent urination.

Although, according to Rabuteau, it exhibits no diuretic action in man, even when taken to the extent of Gm. 5 (gr. lxxv.) a day, yet several physicians have testified to its virtues in *dropsy*, and one of high reputation particularly recommended the nitrate of urea as a remedy for scarlatinous dropsy. It was prescribed in *doses* of Gm. 0.12–0.18 (gr. ij–iij) several times a day.

URETHANUM.—Urethane.

Ethyl urethane, *Ethyl carbamate*, E.; *Uréthane*, Fr.; *Urethan*, G.

Formula $C_2H_5NH_2CO_2$ or $CO.NH_2.OC_2H_5 = C_3H_7NO_2$. Molecular weight 88.94.

In chemistry the general term "urethane" is applied to all ethers of carbamic acid, which acid, however, has thus far never been isolated, and is only known in combination: its most familiar compound is ammonium carbamate, $NH_4NH_2CO_2$, one of the constituents of official ammonium carbonate. If the formula for carbamic acid is assumed to be HNH_2CO_2, then the formation of all urethanes may be explained by the substitution of a univalent radical for the 1 atom of displaceable hydrogen, which may be brought about in various ways.

Preparation.—In medicine the name urethane is meant to signify but one combination, ethyl urethane, which was discovered by Dumas in 1833, and may be obtained either by the action of ammonia on ethyl carbonate or ethyl chlorocarbonate, by the direct union of cyanic acid with ethyl alcohol, or by the action of urea or carbamide on ethyl alcohol at a high temperature. The following equations will explain the four different reactions: 1st. $(C_2H_5)_2CO_3 + NH_3 = C_2H_5NH_2CO_2 + C_2H_5OH$; 2d. $C_2H_5ClCO_3 + NH_3 = C_2H_5NH_2CO_2 + HCl$; 3d. $CNHO + C_2H_5OH = C_2H_5NH_2CO_2$; 4th. $(NH_2)_2CO + C_2H_5OH = C_2H_5NH_2CO_2 + NH_3$. For use in medicine urethane is generally prepared by heating in a sealed tube for several hours, to a temperature of 120° or 130° C. (248° or 266° F.), a mixture of urea nitrate and an excess of alcohol; upon cooling a crystalline mass results, which is dissolved in water and shaken with ether. The ethereal solution upon distillation leaves urethane in crystals which may be purified by recrystallization from water.

Properties and Tests.—Urethane occurs in colorless columnar or tabular crystals, which are not deliquescent, are inodorous, and of a pleasant saline somewhat cooling taste, and melt between 47° and 50° C. (116.6° and 122° F.). Urethane boils between 170° and 180° C. (338° and 356° F.), but sublimes at a much lower temperature. According to Vulpius, urethane is soluble at medium temperature (60° F.?) in 1 part of water, 0.6 part of alcohol, 1 part of ether, 1.5 parts of chloroform, 0.8 part of liquefied carbolic acid, 3 parts of glycerin, 15 parts of castor oil, or 20 parts of olive oil: a 10 per cent. aqueous solution should have a neutral reaction. Heated on platinum-foil, urethane is completely volatilized; it is decomposed by potassa, yielding potassium carbonate, ammonia, and alcohol. 2 Gm. dissolved in 2 Cc. of cold water should not yield a white precipitate upon addition of 5 Cc. of nitric acid, or of oxalic acid or of mercuric nitrate (absence of urea).

Allied Compound.—Europhin, or phenyl urethane, $C_2H_5NHC_6H_5CO_2$, is obtained by the interaction of aniline and chloroformic ethyl ether; thus, $C_6H_5NH_2 + C_2H_5ClCO_2 = C_2H_5NHC_6H_5CO_2 + HCl$, and is purified by recrystallization from diluted alcohol. It is a white or colorless crystalline powder, of faint aromatic odor and slight clove-like after-taste. Europhin is sparingly soluble in cold, but more readily in hot, water, and soluble in alcohol, ether, and hydro-alcoholic mixtures, such as wines, etc.; it is also soluble without color in cold concentrated sulphuric acid. The compound melts between 49° and 50° C. (120.2° and 122° F.).

Action and Uses.—In 1885, Jaksch found that in man a dose of from 8–15 grains of urethane produced peaceful slumber of several hours' duration (*Times and Gaz.*, Oct. 1885, p. 485). It did not appear to exert any direct anodyne influence. Friedländer's

investigations seemed to prove that even in the minute dose of Gm. 0.001 ($\frac{1}{50}$ grain) it occasioned lassitude and depression, with retching and vomiting. The visible mucous membranes turned pale, the pupils acted irregularly, and the pulse and heart failed. But no such effects from similar doses have been noted by other observers. While suffering from pain Friedländer took a drachm of urethane, and secured thereby a comfortable night's rest, while on the following night it excited him (*Therap. Gaz.*, ix. 852). The inharmonious statements concerning the effects of this preparation do not appear to diminish as its use becomes less restricted. Hübner and Sticker affirm that it occasions no unpleasant after-effects, and that a dose of 30 grains is not less hypnotic than a dose of 60 grains; but Otto and Koenig allege that it is more apt than paraldehyde to occasion vomiting, and that its narcotic action is less decided. They also accuse it of producing loss of appetite, etc. On the whole, the action of this preparation resembles that of paraldehyde, over which it has the advantage of being free from unpleasant smell and taste.

The general result of experience appears to be that urethane is an unreliable hypnotic. (Compare Gordon, *Therap. Gaz.*, xiv. 102.) Kroepelin found it useful for melancholic patients suffering from *insomnia* and in cases of "mild excitement or depression accompanied by exhaustion or depressed nutrition" (*Med. News*, xlviii. 626). Otto and Koenig, on the other hand, claim it to have had a very favorable action in violence of an hysterical or epileptic nature, and Rottenbiller seems to have used it with general advantage for the relief of insomnia in the insane in doses of from 30 to 60 grains. He also employed with similar results hypodermic injections, two of which, of 4 grains each, sufficed (*Therap. Gaz.*, x. 474). But, besides its uncertainty of action even in doses of 30 or more grains, it is apt, if continued, to induce disorder of the stomach. (Compare Griffith and Kirby, *Med. News*, lii. 547.) Adam, however, found it a very useful hypnotic in various forms of insanity, provided it were given in doses of Gm. 3–4 (45–60 gr.) (*Annuaire de Thérap.*, 1889, p. 16). Vakulovsky (*Lond. Med. Record*, July, 1886, p. 305) found it of little use in alcoholic delirium, rheumatic pains, sleeplessness, and cancer of the stomach when given in 10-grain doses. A case of traumatic *tetanus* in a boy of fifteen years is said to have been cured by urethane given in 4-grain doses every two hours—a result that it would be desirable to have confirmed by experience. In a case of *tetany* of long standing the medicine gave prompt relief (*ibid.*, Sept. 1889, p. 230). The experiments of Anrep also show the control of this agent over tetanoid spasms (*Bull. de Thérap.*, cxii. 130). A case of severe and obstinate *chorea* is reported in which urethane procured sleep and tranquillity after the bromides had failed to do so (*Boston Med. and Surg. Jour.*, May, 1886, p. 419). In many cases it has been found an efficient substitute for opiates.

Urethane may be given in capsules or in a flavored and sweetened watery solution. Its average dose is about Gm. 1 (gr. xv), but three times as much has frequently been taken without untoward effects. It has also been administered hypodermically, and generally in about one-fourth of the dose given by the mouth, without occasioning infiltration or abscess. But its hypnotic action when thus administered is more uncertain than when the medicine is taken in the ordinary manner. It is conveniently given by the rectum.

Ural partakes of the hypnotic qualities of its constituents, urethane and chloral hydrate. It is declared by Poppi (*Centralb. f. Ther.*, viii. 184; *Therap. Gaz.*, xiii. 687) to affect but slightly the blood-pressure and the temperature; but, like chloral, it quickens the pulse-rate and induces sleep, which in man is usually light, but apt to be followed by more or less heaviness of the head and drowsiness. It neither dulls the mind nor occasions faintness or disturbance of the stomach. It has been used with reputed advantage to relieve obstinate *cough* and the *pain* of *angina pectoris*, to procure *sleep*, etc. The primary dose is said to be Gm. 1.50–2 (gr. xx–xxx). As much as 60 or 70 grains have been given without harm. (See also page 455.)

Euphorin is reported to be antithermic, antirheumatic, analgesic, and antiseptic. According to the experiments, clinical and bacteriological, of Dr. C. Curtis, it is both a powerful and a safe antipyretic, producing the phenomena of a natural defervescence, causes no serious secondary effects and never collapse, and is "a most potent antirheumatic." In "simple fever the dose is Gm. 1–2, taken in four or five doses. In febrile rheumatic affections Gm. 1–2 should be given during twenty-four hours." It is also said to be "a sure analgesic in neuralgia unless when due to a specific cause;" it is a powerful antiseptic; and "one of the most effective disinfectants in thrush." Locally, it is thought to have advantages over iodoform, iodol, aristol, etc.; and in an ointment with vaselin or lanolin it is an anodyne and promotes the healing of wounds and ulcers (Squibb, *Ephemeris*, iv. 26). These favorable estimates of the preparation are hardly confirmed by the later observations of Köster, who described its action as "capricious" (*Therap. Monatsh.*,

Aug. 1892). It has been found useful as a topical application to *ulcers* and for purulent and fetid discharges.

URTICA.—Nettle.

Ortie brulante, Fr.; *Brennessel*, G.; *Ortigo*, Sp.

Urtica dioica, *Linné*, and T. urens, *Linné*.

Nat. Ord.—Urticaceæ, Urticeæ.

Origin and Description.—Both plants are common in waste places, along hedges and roadsides, throughout the greater part of Europe and Northern Asia, and have been thoroughly naturalized in North America, where the small annual, U. urens, is less frequent than the taller perennial, U. dioica. Both species are covered with stiff stinging hairs and have opposite stipulate and petiolate leaves.

Urtica dioica. The leaves are 5–8 Cm. (2 or 3 inches) long, dark-green above, whitish downy beneath, ovate or ovate-lanceolate, heart-shaped, pointed, and coarsely serrate. The small greenish flowers are usually diœcious, in small clusters, and these are arranged in branching and hanging spikes. The bast-fibres have been used for the manufacture of *nettle-cloth*.

Urtica urens. The leaves are 2–5 Cm. (1 or 2 inches) long, pale-green, elliptic, deeply serrate, and almost five-nerved. The small and loose flower-clusters appear in axillary pairs.

Allied Plants.—Urtica (Laportea, *Gaudichaud*) canadensis, *Linné*. The leaves are alternate, 10–15 Cm. (4 to 6 inches) long, long-petioled, ovate or elliptic, obtusely serrate, and strongly feather-veined. The flower-clusters form axillary loosely-paniculate cymes. The plant is common in miry, shaded grounds, attains a height of .9–1.5 M. (3 to 5 feet), is armed with stinging hairs, and has strong bast-fibres.

Urtica crenulata, *Roxburgh*, U. stimulans, *Linné*, and U. urentissima, *Blume*, indigenous to India, are more violently irritating than the above species.

U. pilulifera, *Linné*, grows in India, Central Asia, and in Southern Europe. The fruit, a glossy, gray-brown akene and roundish, somewhat resembles flaxseed, but is smaller, has an oily, mucilaginous, and slightly acrid taste; it is used in Oriental countries as a galactagogue. The root is regarded as diuretic.

The bast-fibres of several nettles in addition to those mentioned above are valuable for cordage and woven fabrics. Urtica cannabina, *Linné*, is cultivated in Siberia. Bœhmeria nivea, *Hooker et Arnott*, of Eastern Asia, yields the *ramie* fibre, from which *China grass-cloth* is made. The variety candicans, *Weddell* (B. tenacissima, *Gaudichaud*) yields the *rhea* fibre. The fabrics often possess considerable brilliancy, and these fibres are used as a substitute for, or are mixed with, silk.

Constituents.—The analyses of the fresh nettle by Saladin (1830) and by Bohlig (1840) proved the presence of mucilage, salts, and other common constituents of plants, and on distilling the herb with water notable quantities of ammonia and carbonic acid were found in the distillate. B. Shoemaker (1866) observed that the watery distillate from the root had diuretic properties. Gorup-Besanez (1849) recognized the irritating compound contained in the stinging hairs as free *formic acid*, which is also contained in the aqueous distillate of the fresh herb. A. Buchner, however, observed that the inflammation produced by free formic acid is of a different character from that produced by nettles, and regarded the presence of another irritating compound besides formic acid as probable.

Action and Uses.—The seeds and leaves of the nettle were much used in ancient times in poultices or bruised for unhealthy ulcers as well as for recent wounds and sprains. The bruised leaves were introduced into the nostrils to arrest epistaxis, and given in honey for the cure of pulmonary catarrhs. The well-known irritation of the skin caused by nettles is due to an acrid secretion contained in a minute vesicle situated at the base of each of the stiff hairs that beset the leaves. When the points of these sharp and hollow spines penetrate the skin, the poisonous juice is expressed into its tissue, and gives rise to a burning and stinging pain, with inflammatory redness and swelling. The case is recorded of a woman who, by mistake, drank 2 cupfuls of a decoction of nettle-leaves. On the following day she experienced severe burning over the whole of the upper part of the body, with formication and stiffness. The features were greatly swollen. Over the affected surface minute vesicles appeared, which burst and discharged a limpid and in some parts a bloody fluid. In the course of five or six days the eruption dried up. No fever accompanied the attack (*Archives gén.*, 1835).

Nettle-juice has always been reputed to be an efficient remedy for spontaneous hæmorrhage of nearly every variety, including *hæmoptysis*, *menorrhagia*, *post-partum hæmor-*

rhage, and *epistaxis*. Allowing for the difficulty of determining the efficacy of any medicine in arresting hæmorrhage, there appears to remain so great a preponderance of evidence in favor of the one under consideration as to render scepticism in regard to it unreasonable, especially as in most of the cases numerous hæmostatics of recognized activity had failed before this medicine was employed. The juice was administered in doses of half an ounce or an ounce at intervals of several hours, and in no case does it appear to have given rise to any disagreeable or untoward effects. This preparation is also reported to have been very efficacious in certain cases of *gravel*, *jaundice*, and *dropsy*, and the seeds have been used in *diarrhœa*, *dysentery*, *leucorrhœa*, and nocturnal *incontinence of urine*. The decoction of the leaves and stalks is also said to display curative powers in chronic *diseases of the skin*, and, as well as the expressed juice, to cure ulcerative affections of the mouth and throat. Poultices made by boiling the fresh leaves have been reputed to cure gangrenous, scorbutic, and other unhealthy *ulcers*. Urtication is the name applied to producing an irritation of the skin by means of nettles. It is performed by taking in the gloved hand a bunch of nettles and flagellating the skin with it until the redness and the stinging pain denote that the intended effect is produced. This rude stimulant revulsion and counter-irritation has been long employed for arousing to consciousness persons affected with *lethargy*, *congestion of the brain*, *intoxication* by *alcohol* or *opium*, or *hysterical insensibility*. It has also been used upon the loins and thighs to cure *amenorrhœa* and *sexual impotence*, and, above all, as a means of restoring power to *paralyzed limbs*. The advantages it presents over blistering, pustulation by croton oil, etc. consist in the vivid and intense impression it produces, and which likens it to electricity and massage. It seems to be a rude expedient, but cases may occur, particularly in the country, for which it would be peculiarly adapted.

In Germany the dried young shoots are used in a decoction made with from 10 to 20 parts to 100 parts of water. The juice of the fresh plant is given internally in tablespoonful doses.

Lamium album (Urtica iners, U. mortua) was long ago used as a domestic remedy for hæmorrhages, scrofula, bronchitis, and leucorrhœa, and was regarded by physicians as tonic and astringent. In 1887 like virtues were ascribed to it by Ménière, and also by Florain, who procured from it a substance which he called *lamine* (*Bull. de Thér.*, cxii. 512).

UVÆ, *Br.*—Raisins.

Uva passa, U. S. 1870; *Passulæ.—Raisin*, F. Cod.; *Rosinen, Zibeben*, G.; *Pasas*, Sp.

The dried fruit of Vitis vinifera, *Linné*. Bentley and Trimen, *Med. Plants*, 66.

Nat. Ord.—Vitaceæ.

Origin.—The Vitis vinifera is indigenous to Western Asia and probably to Northern Africa, and has been cultivated in Europe from a very early period; it has been introduced into North America, chiefly on the Pacific coast, and into other temperate countries. A large number of varieties have been produced, differing in the shape, size, and color of their berries and in other characters. Some botanists refer the different varieties of grapevine to three or four species. The *Catawba*, *Isabella*, *Concord*, and other grapes usually cultivated in the United States are varieties of the indigenous Vitis Labrusca, *Linné*.

The genus Vitis consists of shrubs climbing by tendrils, and bearing these and the greenish, compound-racemose flowers opposite the leaves. The calyx is small, the five petals are united at the apex, fall off together by separating at the base, and alternate with five stamens, which enclose a two-celled ovary, ripening into a juicy berry containing about four hard pyriform seeds.

The tender branchlets (*pampini vitis*) with the leaves are sometimes employed for their agreeable acidulous flavor. The unripe berries (*agresta*) contain a considerable amount of tartaric acid, and yield, when expressed, a very acerb juice (*omphacium*), which after fermentation is suc de verjus, *F. Cod.* The mature fruits, dried, constitute the raisins.

Collection.—When the grapes are ripe their stalks are cut half through or a portion of the bark is removed, and the grapes are allowed to remain upon the vines for a few weeks, and then cut off, sometimes steeped for a short time in a weak lye to remove the waxy bloom, and then completely dried; or the ripe grapes are cut off, spread out upon a hard clay floor, and dried by exposure to the sun, which requires a week or two. In rainy weather artificial heat is used for drying them.

Description.—The ripe berry of the grapevine is one-celled from the obliteration

of the cell-wall, and is globular or oblong in shape. After drying it is shrivelled and flattened, more or less orbicular, of a brownish color, and somewhat translucent. When long kept, raisins become more opaque, owing to the crystallization of the sugar and cream of tartar. Raisins are produced in Southern Europe, and in commerce are distinguished generally by the ports of exportation.

Varieties.—Uvæ malacenses, *F. Cod.*, Passulæ majores.—Raisins de Malaga, *Fr.*—Those produced in Spain are usually preferred, and are ordered by the Br. P. They have either been removed from the stalks, like the *Valencia raisins*, or are sold in bunches, like the *Malaga* or *Muscatel raisins*. The *seedless* or *Sultana raisins* are rather smaller than the Spanish and Italian raisins, and are exported from Asia Minor.

Uvæ corinthiacæ, *F. Cod.*, Passulæ minores.—Corinthian raisins, *E.*: Raisins de Corinth, *Fr.*: Korinthen, *G.*—They are produced in Greece and the adjacent islands, and are often incorrectly called *currants*; they are much smaller than those previously described, are usually deprived of their stalks, mostly adhere together in masses, and have a vinous odor and a sweet and acidulous taste.

Constituents.—The *skin* of ripe grapes contains tannin and coloring matter. The chief constituents of the *pulp* are grape-sugar and acid potassium tartrate, besides gummy matter, calcium tartrate, and a small quantity of malic acid. The *seeds* contain about 5 per cent. of tannin, green resin, and over 10 per cent. of a bland oil (see p. 1130).

Uses.—The pulp of raisins is nutritive and demulcent, and is used to flavor mucilaginous and amylaceous infusions, such as those of flaxseed, oatmeal, rice, barley, etc. In its fresh state the pulp is diuretic, chiefly through the grape-sugar it contains.

Ribes nigrum, or black currant, tops and leaves are stated by Cazin to be astringent, tonic, diuretic, diaphoretic, etc. They were employed in France in hot infusion and also in decoction as a diuretic. An infusion in white wine was considered efficient in chronic *vesical catarrh*. The juice of the fruit is subacid, and is used as a gargle and also in the form of a jelly for *sore throat*.

UVA URSI, *U. S., F. Cod.*—Uva Ursi.

Uvæ ursi folia, Br., P. G.—*Bearberry-leaves*, E.; *Busserole*, *Raisin d'ours*, Fr.; *Bärentraubenblätter*, G.; *Gayuba*, Sp.

The dried leaves of Arctostaphylos (Arbutus, *Linné*) Uva ursi, *Sprengel* (Arct. officinalis, *Wimmer*). Bentley and Trimen, *Med. Plants*, 163.

Nat. Ord.—Ericaceæ, Arbuteæ.

Origin.—The bearberry is a trailing, much-branched, evergreen shrub, which is distributed throughout the northern portion of the northern hemisphere, and grows in most parts of Europe, in Northern Asia, and throughout the North American continent as far south as New Jersey and in the mountains of Colorado. It is found in dry, rocky, or sandy places and in pine woods; southward it grows chiefly in hilly or mountainous regions. It bears short and drooping racemes of from three to twelve whitish, urn-shaped flowers and small, bright-red drupes containing five flattened nutlets, each with one seed. The flowers appear in May, and the fruit ripens in autumn, at which time the leaves should be collected.

Fig. 311.

Arctostaphylos Uva ursi, *Sprengel*.

Description.—Bearberry-leaves are nearly sessile, about 2 Cm. ($\frac{4}{5}$ inch) long, 6–8 Mm. ($\frac{1}{4}$ or $\frac{1}{3}$ inch) wide, obovate or oblong-spatulate, entire, and slightly revolute on the margin, obtuse or apparently retuse at the apex, and almost wedge-shaped at the base. They have a leathery texture, a dark-green rather glossy upper surface, with depressed veins, are paler, smooth, and reticulately-veined beneath, and the leaves have a faint hay-like odor and a strongly astringent and slightly bitter taste.

Constituents.—Meissner (1824) found in uva ursi gallic acid and tannin, producing with ferric salts a blue-black precipitate. Kawalier (1852) corroborated the existence of gallic acid in bearberry-leaves, and to its presence is due the

red and violet color produced by a fragment of ferrous sulphate when agitated with an infusion made from 1 part of uva ursi with 50 parts of water. Bowman (1869) determined the amount of tannin, by means of gelatin, to be 6.33 per cent. Besides resin, sugar, and some other unimportant constituents, Kawalier isolated from the leaves arbutin and ericolin, and Trommsdorff another crystalline body, ursone. *Arbutin*, $C_{24}H_{32}O_{14}.H_2O$, is obtained from the decoction of the leaves by precipitating it with lead subacetate, treating the filtrate with hydrogen sulphide, and evaporating to crystallize. It forms neutral, colorless, silky needles, of a bitter taste, freely soluble in hot water and in alcohol, and sparingly soluble in ether. Julius Jungmann (1872) observed that an aqueous solution of arbutin, rendered alkaline by ammonia or potassa, acquires a deep azure-blue color on the addition of phosphomolybdic acid. On being dissolved in strong nitric acid, arbutin yields, after the addition of alcohol, pale-yellow needles of *dinitro-arbutin*. By emulsin or by hot diluted sulphuric acid arbutin is decomposed into glucose and *hydroquinone* or *arcturin*, $C_6H_6O_2$, and *methylhydroquinone*, $C_7H_8O_2$. Hydroquinone crystallizes in colorless, fusible, and sublimable prisms, is easily soluble in water, alcohol, and ether, and is also produced from kinic acid by destructive distillation. On oxidizing hydroquinone or arbutin with manganese dioxide and sulphuric acid *quinone* is formed (see page 360). Hughes' *ursin* (1847) was proven by Jungmann to be impure arbutin.

The mother-liquor from the preparation of arbutin contains *ericolin*.

Ericinol, $C_{10}H_{16}O$, a decomposition-product of the glucoside *ericolin*, $C_{34}H_{56}O_{21}$, which was discovered by Rochleder and Schwarz (1852), is likewise contained in other ericaceous plants, and is inodorous, hygroscopic, brown-yellow, bitter, soluble in water, alcohol, and alcoholic ether, nearly insoluble in ether, chloroform, and benzin, and not precipitated by lead salts. Thal (1883) gives to ericolin the formula $C_{26}H_{30}O_3$, and to ericinol $C_{20}H_{26}O$; combining with water, the latter forms *hydro-ericinol*, $C_{10}H_{20}O_4$, which is a thick, brown-yellow, balsamic, not bitter fluid. Thal obtained ericolin from over thirty species of Ericaceæ. After washing the alcoholic extract of bearberry-leaves with water and ether, boiling alcohol extracts from the residue *ursone*, $C_{20}H_{34}O_2$; this crystallizes in tasteless, silky, fusible, and sublimable needles, is insoluble in water, dilute acids, and alkalies, and is sparingly soluble in ether and cold alcohol.

Arbutin, ericolin, and ursone have been obtained also from the leathery leaves of other ericaceous plants.

Adulterations and Substitutions.—The leaves of the following plants are said to have been sometimes mistaken for those of uva ursi:

Vaccinium vitis-idæa, *Linné*. It is known as *cowberry*, and grows from New England northward and in Europe. The leaves resemble those of uva ursi, but are not reticulate, and on the lower surface are dotted with fine, blackish, bristly points.

Vaccinium uliginosum, *Linné*. This is known as *bog-bilberry*, and grows in Europe and the northern part of North America. The leaves are scarcely leathery, and are pale blue-green and pubescent on the lower surface; otherwise they resemble the leaves of uva ursi.

Leiophyllum buxifolium, *Elliott*. The *sand-myrtle*, indigenous to the United States from New Jersey southward, is a small shrub. Its leaves are oval or oblong, shining, reticulate, and revolute on the margin.

Buxus sempervirens, *Linné*. The box, commonly cultivated in gardens, has ovate leaves, which are narrower toward the apex than near the base. The leaves contain tannin (Buchner), butyraceous volatile oil, bitter extractive, etc. (Bley, 1834); the bitter taste is due to *buxine* and *parabuxine*. (See Nectandra and Pareira Brava.)

Epigæa repens, *Linné*. Trailing Arbutus, Ground-laurel, Gravel-plant, May-flower, *E. Nat. Ord.* Ericaceæ, Ericineæ. This is a prostrate hairy North American shrub about 30 Cm. (1 foot) long, growing in sandy woods and flowering in early spring. The thin woody stem is covered with a brown bark. The evergreen leaves are alternate, about 5 Cm. (2 inches) long, petiolate, coriaceous, and reticulated; their shape is ovate, the margin entire, the base heart-shaped, and the apex tipped with a short point. The flowers are in small axillary clusters, rose-colored or whitish, fragrant, have a deeply five-parted bracted calyx, a salver-form corolla with the tube hairy inside, ten stamens, and produce five-lobed and five-celled capsules containing numerous seeds. The leaves are inodorous, and have a bitterish and astringent taste. The leaves contain tannin, which produces a black precipitate with iron salts. Using gelatin as a precipitant, H. K. Bowman (1869) determined its amount to be 3.5 per cent. Jefferson Oxley (1872) proved the constituents to be identical with those of uva ursi—namely, *arbutin*, *ursen*, and *ericolin*. Formic acid was also found, and a principle having in its behavior to tests some resemblance to gallic acid, without, however, yielding pyrogallic acid.

Oxydendrum arboreum, *De Candolle*, s. Andromeda arborea, *Linné*, *sorrel tree* or *sour wood*, is about 12 M. (40 feet) high. The leaves are deciduous, oblong-lanceolate, pointed, serrulate on the margin, and nearly smooth. They resemble peach-leaves in shape and have a refreshing acidulous taste. The tree grows in the Alleghanies and westward to Arkansas.

All the species named above belong to North America.

Allied Species.—Arctostaphylos glauca, *Lindley.* This shrub or small tree grows in dry and rocky localities on the western slope of the Sierras in California, where it is known as *manzanita.* The leaves are about 5 Cm. (2 inches) long, coriaceous, ovate-oblong, acute above and rounded or obtuse at the base, entire on the margin, and of a pale-green color. It was examined by J. H. Flint (1873), and found to contain arbutin, 9.8 per cent. of tannin, and 6 per cent. of ash. The leaves are employed like uva ursi.

Arc. polifolia, *Kunth*, A. mucrocifera, *De Candolle*, are employed in Mexico like uva ursi: also the shrubs known as *madrona*, Arc. tomentosa, *Douglas*, and Arbutus xalapensis, *Kunth*: this last species extends into Western Texas.

Action and Uses.—Uva ursi, or bearberry, in small doses appears to promote the appetite and confine the bowels, but in large quantities it occasions vomiting and purging. On the healthy system it does not produce any diuretic action, but in calculous affections the urine sometimes seems to augment under its influence. It gives to this secretion a dark color and a peculiar odor. According to Lewin, the most active constituents of uva ursi are tannin and arbutin. The latter undergoes decomposition in the system and generates hydroquinone, which is antiseptic and antizymotic and retards the putrefaction of urine (*Therap. Gaz.*, Sept. 1883). Some observers ascribe a diuretic operation to arbutin, but it is not clinically or physiologically established. Arbutin certainly does not represent all the virtues of uva ursi, especially in the diseases for which the latter is most frequently employed.

Uva ursi appears to have been first used by physicians about the middle of the eighteenth century. It was then employed in calculous affections and in all chronic disorders of the urinary passages, from the kidneys to the urethra. It has proved useful in chronic *pyelitis* and *cystitis*, and even in calculous forms of those affections, probably by constringing the mucous membrane of the kidneys and bladder, diminishing its vascularity, and thereby obtunding its sensibility. In many cases, as a consequence of this mode of action, it has caused the parts affected to become more or less insensible to the mechanical irritation of the concretions enclosed by them, and thereby lessened the impediment to the passage of the urine. In this manner, no doubt, it often relieves *incontinence of urine*, *dysury*, and *strangury*. So complete is the relief sometimes afforded by it that a notion once gained credit of its being a solvent of *urinary calculi*. But, in truth, its mode of action is in great part like that of lime-water, whose efficacy under analogous circumstances is well known: it renders the mucous membrane of the urinary passages less susceptible to mechanical irritation. The benefits of the medicine in most of the cases referred to are only to be obtained by its persistent use. But in strangury from blisters its action is sometimes very prompt. Uva ursi has been also used with advantage for chronic *bronchitis* and atonic *diarrhœa*, *leucorrhœa*, and *hæmorrhage*, especially uterine hæmorrhage. It is said to act as an *oxytocic*. Arbutin is stated, but upon insufficient grounds, to be an efficient diuretic in *cardiac dropsy*, and it has also been prescribed with alleged advantage in *urethritis*. It may be taken in large doses without any ill effect. As a diuretic it has been given in doses of about Gm. 1 (gr. xv) per diem, mixed with powdered sugar; and also in a 5 per cent. watery solution. Lewin recommends that a decoction should be prepared with from 30 to 80 parts of the leaves to 180 parts of water, and its tannin removed with charcoal. But this removal impairs the energy of the preparation. Arbutin may also be given with powdered sugar to the extent of Gm. 0.6–0.8 (gr. x–xij) a day.

The *dose* of uva ursi in powder is generally stated to be Gm. 1.30–4 (gr. xx–lx), but its most striking effects have been obtained by doses not greater than a fourth of those just mentioned. The decoction, infusion, and fluid extract of uva ursi are efficient; the last is officinal.

Buxus sempervirens was found by Ringer and Murrell to produce tetanus, followed by paralysis, in frogs (*Med.-Chir. Trans.*, lix. 389). A decoction has been used to cure, by sweating, syphilis, rheumatism, gout, intermittent fever, etc. In over-doses it may act as an emeto-cathartic. Buxine, besides such effects, is said to cause disorder and sedation of the nervous system. A decoction of the leaves applied to the scalp to prevent the hair from falling out, and accidentally to the face, produced an eczematous eruption on the latter (*Boston Med. and Surg. Jour.*, Dec. 1889, p. 583).

Oxydendron arboreum is said to be diuretic and laxative. A semi-solid extract in doses of Gm. 0.20–0.80 (gr. iij–xij) a day is said to have removed dropsical swellings.

Epigæa (*trailing arbutus*) has been compared with uva ursi and buchu; it possesses some astringency like the former, and has been used for the relief of *strangury* and *vesical catarrh*. A decoction is prepared with Gm. 32 (℥j) of the dried leaves and stems in Gm. 500 (Oj) of water, and given in the *dose* of a wine-glassful three or four times a day.

VALERIANA, *U. S.*—Valerian.

Valerianæ rhizoma, Br.; *Radix valerianæ*, P. G.; *Radix valerianæ minoris.*—*Valerian-root*, E.; *Valériane officinale*, F. Cod.; *Baldrian*, G.; *Valeriana sylvestre*. Sp.

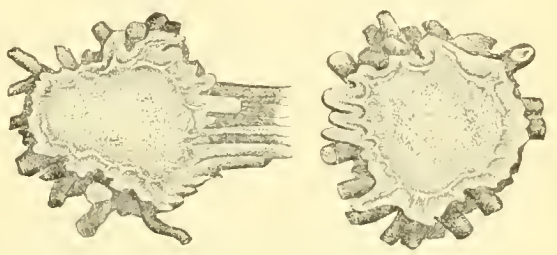
The root of Valeriana officinalis, *Linné*. Bentley and Trimen, *Med. Plants*, 146.

Nat. Ord.—Valerianaceæ.

Origin.—Valerian is a native of Europe from the Mediterranean northward, and of Northern Asia, and is cultivated to some extent in Holland and England, and in this country in New England and New York. It is an herbaceous perennial, and grows on the banks of streams and other wet places, and likewise in uplands and dry situations. It varies considerably in size and in foliage, and several of the varieties have been regarded by some botanists as distinct species. The plant is easily propagated from short horizontal runners. It is .6–1.2 M. (2 to 4 feet) high, branching at the top, has opposite, clasping, long-petiolate and oddly pinnate leaves, with from four to ten pairs of oval or lance-linear, entire or toothed, sessile, and smooth leaflets, and bears compound cymes composed of numerous small pinkish, triandrous flowers. The fruit is an ovoid, compressed akene, crowned by a plumous pappus. The rhizome with the rootlets attached constitute the official portion, and is collected in autumn.

Description.—The rhizome of valerian is upright, subglobular or obconical, truncate below, and at the apex often crowned with short portions of the overground stem or with a tuft of short leaf-bases, and indistinctly marked with closely approximate leaf-scars. It varies in length between about 1–3 Cm. ($\frac{1}{2}$ and 1¼ inches), has a diameter nearly of the same dimensions, and is on all sides furnished with numerous slender nearly cylindrical rootlets. These are from 5–15 Cm. (2 to 6 inches) long, about 3 Mm. ($\frac{1}{8}$ inch) thick at the base, simple, except near the tip, where they are divided into numerous fine fibres, which are rarely present in the commercial drug. A few short stolons, with long internodes, are occasionally attached to the rhizome. The rhizomes collected from dry situations are the smallest, have a light yellowish-brown color, are subglobular in shape, have a comparatively large number of rather short, thin, and light-colored rootlets attached, and are preferred for medicinal purposes on account of the larger proportion of volatile oil contained in them. The rhizomes collected in wet localities are more elongated, of larger dimensions, more fleshy and hygroscopic, and are therefore frequently cut longitudinally to facilitate their drying; they are darker in color, near the lower end marked by scars from decayed rootlets, and near the middle and upper portion have longer, thicker, and darker-colored rootlets than the preceding variety, attaining a length of 25–30 Cm. (10 or 12 inches). The rootlets of valerian are rather brittle and break with a short fracture; the rhizome is tougher, and in the interior rather horny and of a light grayish-brown color. It has a thin bark, which by a dark cambium-line is separated from a narrow circle of whitish woody tissue, and this encloses a large central pith. The rootlets have a thick bark surrounding a slender ligneous cord. Under the microscope the parenchyma is seen to contain cells filled with starch, extractive matter, and oil or resin. The recent rhizome has a very slight odor, but on drying a peculiar somewhat camphoraceous and terebinthinate odor appears, which on long keeping gradually changes to a strong somewhat cheese-like odor. The taste of valerian is at first sweetish, afterward unpleasant, camphoraceous, and somewhat bitter. The rootlets of the commercial drug sometimes cover a large amount of dirt.

Fig. 312. Fig. 313.



Longitudinal and transverse section of rhizome of Valerian.

Constituents.—The most important constituent of valerian is its volatile oil (see page 1116), which varies in proportion between about $\frac{1}{2}$ and 2 per cent., the fresh rhizome from dry soil yielding the larger amount. Cultivated valerian seems to be less rich in volatile oil. Recent valerian on being distilled with water yields a distillate which, according to Schoonbroodt (1868), is neutral or nearly so. Free valerianic acid does not exist in fresh valerian, but is generated from the volatile oil on exposure. The relative proportions of the volatile oil and valerianic acid must therefore vary with the age of the drug. Aschoff (1846) found in the root also malic, acetic, and formic acids. The constituents which are of less medicinal importance are tannin, extractive, sugar, starch, mucilage, resin, etc.

Admixtures.—Although valerian is readily distinguished from other medicinal roots, it has been sometimes observed sophisticated with poisonous drugs somewhat resembling valerian in appearance, and from contact with the latter having acquired to some extent its peculiar odor. Cynanchum Vincetoxicum (p. 299) was noticed by Charbonnier (1877), Veratrum album (see below) by Holmes (1877), and Sium latifolium (p. 477) by Bernbeck (1880).

Pharmaceutical Preparations.—AQUA VALERIANÆ. Distil 1 part of bruised valerian with sufficient water to obtain 4 parts of distillate.—*F. Cod.*

SYRUPUS VALERIANÆ. Extract of valerian 4 Gm., valerian-water 100 Gm., sugar 180 Gm.—*F. Cod.*

SPIRITUS ANGELICÆ COMPOSITUS. Valerian 4 parts, juniper-berries 4 parts, angelica 16 parts, alcohol 75 parts, and water 125 parts; distil 100 parts, and dissolve in the distillate camphor 2 parts.—*P. G.*

Allied Drugs.—VALERIANA PHU, *Linné*, is a tall perennial of Western Asia and Southern Europe, and is occasionally cultivated. The root was known as *radix valerianæ majoris*, and consists of an oblique rhizome which is 10–15 Cm. (4 to 6 inches) long, about 12 Mm. (½ inch) thick, is distantly annulated, of a brown color, on the lower side furnished with numerous yellowish rootlets, and has a much weaker odor and taste than official valerian.

VAL. MEXICANA and V. TOLUCANA, *De Candolle*, of Mexico, yield much valerianic acid, and are used like the official drug.

NARDUS SPICA CELTICA is the rhizome of Valeriana celtica, *Linné*, a native of the Alps. It is thin, about 75 Mm. (3 inches) long, densely covered with brown scaly leaf-remnants, has long simple rootlets on the lower side, and possesses a strong odor and a taste of valerian.

NARDUS INDICA, S. SPICA NARDI, or true *spikenard*, formerly much employed, is obtained from Nardostachys (Valeriana, *Roxburgh*) Jatamansi, *De Candolle*, indigenous to India. It is about 6 Mm. (¼ inch) thick, densely beset with numerous fibrous remnants of leaf-stalks, and has a bitter aromatic taste and penetrating odor resembling that of serpentaria.

PATRINIA SCABIOSÆFOLIA, *Link*. The root is known in Japan as *kesso*, and was sent to England in 1879. It resembles valerian in appearance, odor, and taste, but has a short rhizome, not over 8 Mm. (⅓ inch) thick, and this is densely covered with dark-brown scaly rootlets, which are 5–10 Cm. (2 to 4 inches) long.

Action and Uses.—Valerian is not a cure for *hysteria*, but it is a most valuable palliative when employed to avert or mitigate hysterical paroxysms provoked by some accidental cause. Especially is this the case in females of weak constitution and excitable temperament, and who are exhausted by care and anxiety. It is still more efficient in preventing the development of those hysteroidal attacks which weak and morbidly sensitive girls and women are liable to, and which consist in an excessive susceptibility to impressions, and in the power of converting into real sensations the suggestions of a disordered fancy, whereby countless subjective perceptions and various disordered actions of the lungs, heart, stomach, etc. arise. In mild cases of *mental derangement*, especially when caused by nervous shock or strain; in nervous *atony* simulating paralysis; in cases also of irregular distribution of the blood, accompanied, it may be, with indications of cerebral congestion, or, on the other hand, of cerebral anæmia, of which the chief symptoms are *vertigo*, a sense of rush of blood to the head, or fainting, confusion of sight and hearing, etc., which more than at any other time are apt to occur about the menopause, —valerian is the most promptly efficient of all the palliatives that have been used. In all these cases valerian exhibits the same potency as asafetida, musk, and castor, and more decidedly. Oil of valerian dissolved in ether may be administered by inhalation in such attacks. Valerian is one of the best remedies for *nervous headache*, especially when it is associated with ammonia, as in the ammoniated tincture of valerian or the popular elixir of ammonium valerianate. These preparations may be used advantageously, along with a carminative tincture, in cases of *flatulence* accompanied with palpitation of the heart. The same medicines are equally efficient in relieving *infantile colic*, an affection for which domestic medicine generally provides an analogous remedy in catnep.

Valerian is one of the innumerable articles that from time to time have been vaunted as remedies for *epilepsy*, and, allowing for the common error of confounding epilepsy with epileptiform reflex convulsions, and even with hysteria, there can be no doubt that it has sometimes cured the disease in females and young children, and especially when it originated in fright or some analogous impression. Even in these cases it must be administered in large doses and be long continued, while other and especially hygienic measures are employed to give permanent strength to the nervous system.

Valerian is useful in the treatment of the milder forms of *delirium tremens*, especially when they follow surgical operations or injuries, and in the ataxic phenomena which belong to the *typhoid state* of fevers and inflammations. It has had some reputation as a *vermifuge* for children when associated with purgatives, such as jalap, and by

enema as a remedy for ascarides of the rectum. It has also been used successfully for the relief of *dysmenorrhœa* and in *polyuria* or *diabetes insipidus*. Bouchard, however, claims that when the urine contains an excess of urea (azoturia) or of sugar (glycosuria), valerian diminishes the amount of solids discharged and thus acts as a conservator of tissue and of force. Butte, on the other hand, maintains that valerian causes the destruction of the glucose in the blood (*Univers. Med. Mag.*, iii. 498).

Valerian may be prescribed in powder in *doses* of Gm. 2–6 (gr. xxx–xc), repeated three or four times a day. Its disagreeable taste may be masked by the addition of an aromatic powder. Of its several preparations, the infusion and the fluid extract are to be preferred; next to these ranks the oil. The tincture, however, is officinal, and so is the ammoniated tincture, which is decidedly preferable to either the simple tincture or the fluid extract.

Caffeine Valerianate (so called) was tried by Paret (1775) in hysteria to moderate *nervous vomiting*, and in some cases with success, the medicine appearing to act as a general stimulant; in the vomiting of phthisis it was useless, but in *whooping cough* it decidedly lessened the paroxysms. It was given in pills, in the dose of Gm. 0.10 (gr. ij) three times a day.

VANILLA, *U. S.*—Vanilla.

Fructus (*s. Siliqua*) *vanillæ*, P. G.—*Vanille*, Fr. Cod., G.; *Vainilla*, Sp.

The prepared unripe fruit of Vanilla planifolia, *Andrews*. Bentley and Trimen, *Med. Plants*, 272.

Nat. Ord.—Orchidaceæ.

Origin.—The name "vanilla" is derived from the Spanish *baynilla*, the diminutive of *bayna*, a pod. The plant is indigenous to Eastern Mexico, where it grows in hot, moist woods, and is cultivated by fastening shoots to trees just above the ground, where they soon strike root, begin to produce fruits in about three years, and continue to bear for about thirty years. The plant has a long fleshy stem, supporting itself by simple aërial rootlets, alternate sessile, fleshy, oval-lanceolate leaves, and axillary spikes of large greenish-white flowers, with a depressed recurved and crenate lip, and with an elongated, fleshy, cylindrical ovary. The cultivated plant is Schiede's Vanilla sativa. The wild-growing plant (Schiede's V. sylvestris) is usually regarded as a mere variety of the former, and yields a smaller and less aromatic fruit, known in Mexico as *baynilla cimarona*. The vanilla-plant has been introduced into some of the West Indian islands, into Bourbon, Madagascar, and several East Indian islands. In its native country it is probably fertilized through the agency of insects; in other countries artificial fertilization is required.

Collection.—The fruit is collected before it is ripe, when the green color begins to change. In order to develop its aroma and to prevent its dehiscence, the unripe fruit is partly sun-dried or exposed to artificial heat, and then wrapped in blankets until it begins to sweat, when the exposure and subsequent wrapping up are repeated. Steeping in hot water is said to be in some places resorted to previous to drying. Some of the constituents are supposed to undergo a kind of fermentation, through which the odorous principle is developed. After the fruits have obtained the proper dark color, agreeable aroma, and sufficient dryness, they are tied into bundles of fifty, weighing a little over 8 ounces, and these are sometimes wrapped in tin-foil and packed in tin boxes.

Properties.—The cultivated vanilla-fruit is known in Mexico as *baynilla corriente*, and is further distinguished and assorted according to its size and the thickness of its integuments. The finest quality attains a length of 30 Cm. (12 inches), has a thin pericarp, and is rarely seen in our market. The varieties usually met with are from 15–25 Cm. (6 to 10 inches) long, about 8 Mm. (⅓ inch) thick, and somewhat triangular, but flattened. Vanilla is of a dark-brown color, glossy, longitudinally wrinkled, somewhat narrowed at both ends, bent or hooked at the base, and rather oblique at the apex. The surface is frequently marked with a few circular or oblong warts, and some varieties are more or less covered with an efflorescence of acicular crystals. The integuments of the fruit are leathery, of a brown color; the interior is filled with a blackish-brown fragrant pulp, in which very numerous minute black flattish-ovate seeds are imbedded. The fruit is one-celled, and has three parietal placentæ, each projecting with four curved branches into the interior. The parenchyma of the integuments contains extractive, oil drops, and crystals of vanillin and calcium oxalate, and an irregular circle of about twenty delicate fibro-vascular bundles.

Varieties.—Mexican vanilla is regarded as the best. Bourbon vanilla resembles it, and is usually covered with crystals, but has an odor somewhat suggesting that of tonka. Costa Rica vanilla is less attennated at the ends, and has hardly the fine flavor of the Mexican variety. Vanilla from the Seychelles is considerably thinner. A vanilla is produced in Venezuela which is 7–15 Cm. (3 to 6 inches) long, rather thick, and of a decided tonka flavor. Van. microcarpa, *Karsten*, a native of Venezuela, has a very aromatic fruit, about 75 Mm. (3 inches) long and 5 Mm. ($\frac{1}{5}$ inch) broad. In Brazil, Peru, and other parts of South America a broad and fleshy vanilla is obtained which is 15–20 Cm. (6 to 8 inches) long, about 12 Mm. ($\frac{1}{2}$ inch) wide, and of an inferior vanilla odor; it is probably the fruit of Vanilla pompona, *Schiede*. It is not unlikely that several other species besides those mentioned above yield vanilla, but the different species are very imperfectly known. Vanilla guianensis, *Splitberger*, indigenous to the north-eastern portion of South America, may yield some of the South American vanilla. Vanilla palmarum, *Lindley*, a native of Bahia, has a thick cylindrical not very fragrant fruit about 5 Cm. (2 inches) long. Vanilla aromatica, *Swartz*, is indigenous to South America, but not to Mexico, and its fruit is said to be not aromatic.

Constituents.—According to the analysis of Bucholz (1828), vanilla contains about 11 per cent. of fixed oil, 2.3 per cent. of soft resin, 6 per cent. of sugar, 11 per cent. of gum, and considerable extractive matter. Leutner (1872) obtained 4 per cent. of resin, 6.6 gum, 10 sugar, 4.7 per cent. of ash, and, besides a little wax and tannin, also oxalic and other acids. The odor of vanilla is not due to a volatile oil. The crystalline efflorescence was for a long time regarded as identical with either benzoic or cinnamic acid, but Bley (1831) proved it to be distinct from both, and Gobley (1858) established its difference from coumarin and named it *vanillin*. It is obtained from the alcoholic extract of vanilla by diffusing it in a little water, agitating with ether, and evaporating the ethereal liquid; the brown odorous residue yields to boiling water vanillin, which is purified by recrystallization and treatment with animal charcoal. Vanillin crystallizes in hard, colorless, four-sided prisms; has the odor of vanilla and a pungent, warm taste, melts near 80° C. (176° F.); sublimes when carefully heated; has a feeble acid reaction, and is freely soluble in boiling water, in alcohol, ether, fats, and volatile oils. It does not decompose alkaline carbonates, but dissolves in caustic alkalies, and is precipitated unaltered from the solutions on the addition of an acid; its aqueous solution is not affected by salts of tin, mercury, and silver, yields a pale-yellowish precipitate with basic lead acetate, and strikes a dark-violet color with ferric chloride. It dissolves in sulphuric acid with a yellow color, and by nitric acid is oxidized to oxalic acid. On account of its feeble acid properties Stokkebye (1864) proposed to name it *vanillic acid* (see below). Carles (1870) found its formula to be $C_8H_8O_3$, and this was corroborated by Tiemann and Haarmann (1874–78), who prepared vanillin artificially from *coniferin*, $C_{16}H_{22}O_8$, a compound contained in the sap of coniferous trees; this on being treated with emulsin is spilt into sugar and *coniferyl alcohol*, $C_{10}H_{12}O_3$, which on being oxidized with a mixture of sulphuric acid and potassium dichromate, like coniferin itself, yields vanillin. Vanillin was recognized as the aldehyde of methyl-protocatechuic acid, $C_6H_3.OCH_3.OH.CHO$; by careful oxidation this is converted into the nearly inodorous *vanillic acid*, $C_6H_3.OCH_3.OH.COOH$. The same authors have further shown the relation of these interesting principles to creosol, eugenol, ferulaic acid, caffeic acid, and other compounds, and devised a process for the artificial preparation of vanillin from oil of cloves, and propose (1875) to estimate the amount of vanillin by completely exhausting not less than 30 Gm. of cut vanilla with ether, concentrating the ethereal tincture, agitating the liquid repeatedly with solution of sodium bisulphite, decomposing the mixed aqueous liquids with dilute sulphuric acid, and dissolving the liberated vanillin by agitation with ether. Mexican vanilla yielded 1.3–1.7, Java vanilla 1.6–2.75, and Bourbon vanilla 0.75–2.9 per cent. of pure vanillin: the last two varieties were found to contain, in addition, an oily matter having a disagreeable odor; and the fruit of Van. pompona, which yielded .4–.7 per cent. of vanillin, was observed to contain another compound, probably *benzaldehyde*, which modifies the odor of the former.

The poisonous effects repeatedly observed to be due to the use of vanilla as a flavor for ices have been referred by Schroff, in the absence of metallic poisons, to the presence of cardol, resulting from the alleged employment of the fixed oil of the cashew-nut (see p. 207) for improving the appearance of vanilla.

Pharmaceutical Uses.—Vanilla is employed in perfumery.

Pulvis vanillæ cum saccharo, *U. S.*, Vanilla saccharata. 1 part of finely-cut vanilla and 9 parts of sugar are triturated together until a grayish-white uniform

powder is obtained, or 2 parts of vanillin dissolved in alcohol are mixed with 98 parts of sugar.

SYRUPUS VANILLÆ. Mix simple syrup with sufficient tincture of vanilla until the desired flavor is obtained.

Action and Uses.—Workmen engaged in handling vanilla-beans suffer from itching of the hands and face; the skin is covered with a pruriginous eruption, and swells, reddens, and desquamates. Others are affected with dizziness, weariness, and muscular pains. The eruption is produced by an acarus, which irritates without penetrating the skin (*Jour. Amer. Med. Assoc.*, i. 621). In Mexico, its native country, the Spanish conquerors found vanilla in common use for flavoring chocolate, and for this purpose it continues to be extensively used. Very probably it promotes the digestion of this aliment, as it does that of many other fatty and farinaceous articles of food, and therefore may be classed with the aromatics. In its action it has some analogy with balsam of Peru. Like the aromatics generally, aphrodisiac qualities are attributed to it. Cases of poisoning by ice-cream flavored with vanilla seem to have been caused by fermentative changes in the cream or milk employed. In medicine vanilla is rarely employed alone, but it may be prescribed in powder in *doses* of Gm. 0.30–2 (gr. v–xxx), mixed with sugar. A syrup made with it and the officinal tincture form agreeable flavoring ingredients of mixtures. It may be added also to troches for a similar purpose, as it is in the officinal troches of iron.

VAPORES.—INHALATIONS.

These are mixtures, consisting of water with a volatile substance, which are perhaps never made by the apothecary, and appear to be better adapted for extemporaneous prescription. The *vapores*, as originally employed in medicine, are external applications.

VAPOR ACIDI HYDROCYANICI, *Br.*—INHALATION OF HYDROCYANIC ACID.

Take of Diluted Hydrocyanic Acid 10 to 15 minims; Water (cold) 1 fluidrachm. Mix in a suitable apparatus, and let the vapor that arises be inhaled.—*Br.*

Uses.—The "inhalation of hydrocyanic acid" is too dangerous a remedy to be recommended under any circumstances. The difficulty, if not impossibility, of determining the exact strength of the solution, the various degrees of susceptibility to its action, and the promptly fatal effects of an overdose inhaled, should condemn it as a medicine.

VAPOR CHLORI, *Br.*—INHALATION OF CHLORINE.

Take of Chlorinated Lime 2 ounces; Water (cold) a sufficiency. Put the powder into a suitable apparatus, moisten it with the water, and let the vapor that arises be inhaled.—*Br.*

Uses.—This preparation is a convenient means of obtaining chlorine for inhalation, but the necessity of making it officinal by prescribing the exact amount of chlorinated lime to be used is the reverse of apparent.

VAPOR CONINÆ, *Br.*—INHALATION OF CONINE.

Take of Juice of Hemlock ½ fluidounce; Solution of Potash 1 fluidrachm; Distilled Water 1 fluidounce. Mix. Put 20 minims of mixture on a sponge in a suitable apparatus, so that the vapor of hot water passing over it may be inhaled.—*Br.*

The potassa is added for the purpose of liberating the coniine contained in the juice.

Uses.—The proportion of the extract of conium directed for this preparation, must vary according to the strength of the extract used; which, being very uncertain, the "inhalation" cannot be of uniform power.

VAPOR CREOSOTI, *Br.*—INHALATION OF CREOSOTE.

Take of Creosote 12 minims; Boiling Water 8 fluidounces. Mix the creosote and water in an apparatus so arranged that air may be made to pass through the solution, and may afterward be inhaled.—*Br.*

Uses.—This "inhalation" appears to be a very superfluous officinal preparation. The proportion of creosote used should vary with the condition it is intended to remedy.

VAPOR IODI, *Br.*—Inhalation of Iodine.

Take of Tincture of Iodine 1 fluidrachm; Water 1 fluidounce. Mix in a suitable apparatus, and, having applied a gentle heat, let the vapor that arises be inhaled.—*Br.*

Uses.—According to our experience, the proportion of tincture of iodine in this "inhalation" is entirely too large for ordinary use if the iodine is vaporized rapidly. It should be left to the judgment of those who are skilful enough to use such a preparation at all. Conine, creosote, and iodine are more efficaciously used by inhalation in atomized solutions.

VAPOR OLEI PINI SYLVESTRIS, *Br.*—Inhalation of Fir-wool Oil.

Take of Fir-wool Oil 40 minims; Light Magnesium Carbonate 20 grains; Water a sufficiency. Rub the fir-wool oil with the magnesium carbonate, and gradually add sufficient water to produce 1 fluidounce. Put 1 fluidrachm of this mixture with 10 ounces of boiling water into an apparatus so arranged that air may be made to pass through the solution and may afterward be inhaled.—*Br.*

Uses.—As an inhalation in chronic affections of the air-passages.

VERATRINA, *U. S., Br., F. Cod.*—Veratrine.

Veratria, Br.; *Veratrinum*, P. G.—*Vératrine*, Fr.; *Veratrin*, G.

Nat. Ord.—Liliaceæ.

A mixture of alkaloids obtained from the seed of Asagræa officinalis (*Schlechtendal* and *Chamisso*), *Lindley*.

Origin.—The mixture of alkaloids which is recognized by the pharmacopœias under the above names was first prepared by Meissner (1819) from sabadilla and named *sabadilline*. Pelletier and Caventou (1819) prepared similar substances from sabadilla and white veratrum, and called them *veratrine*, which name has since been applied to the product from the former source only (see also Veratrum Album); and this was known in an amorphous condition, and supposed to be uncrystallizable until Merck (1855) showed that a portion of it could be crystallized. Sabadilla-seeds are used for preparing veratrine; Schroff (1863), however, has shown that the capsules are very poisonous and probably contain the same alkaloids.

Preparation.—Take of Cevadilla 2 pounds; Distilled Water, Rectified Spirit, Solution of Ammonia, Hydrochloric Acid, each a sufficiency; Purified Animal Charcoal 60 grains. Macerate the cevadilla with half its weight of boiling distilled water in a covered vessel for twenty-four hours. Remove the cevadilla, squeeze it, and dry it thoroughly with a gentle heat. Beat it now in a mortar, and separate the seeds from the capsules by brisk agitation in a deep, narrow vessel or by winnowing it gently on a table with a sheet of paper. Grind the seeds in a coffee-mill and form them into a thick paste with rectified spirit. Pack this firmly in a percolator, and pass rectified spirit through it till the spirit ceases to be colored. Concentrate the spirituous solution by distillation so long as no deposit forms, and pour the residue, while hot, into twelve times its volume of cold distilled water. Filter through calico, and wash the residue on the filter with distilled water till the fluid ceases to precipitate with ammonia. To the united filtered liquids add the ammonia in slight excess; let the precipitate completely subside, pour off the supernatant fluid, collect the precipitate on a filter, and wash it with distilled water till the fluid passes colorless. Diffuse the moist precipitate through 12 fluidounces of distilled water, and add gradually, with diligent stirring, sufficient hydrochloric acid to make the fluid feebly but persistently acid. Then add the animal charcoal, digest at a gentle heat for twenty minutes, filter, and allow the liquid to cool. Add ammonia in slight excess, and when the precipitate has completely subsided pour off the supernatant liquid, collect the precipitate on a filter, and wash it with cold distilled water till the washings cease to be affected by silver nitrate acidulated with nitric acid. Lastly, dry the precipitate first by imbibition with filtering-paper, and then by the application of a gentle heat.—*Br.*

Alcohol extracts from sabadilla-seeds veratrine in its natural combination with veratric acid. On evaporating the alcohol, diluting the syrupy liquid with water, and filtering from the resin, the liquid contains veratrine veratrate, and this salt is decomposed by ammonia or potassa; the alkaloid thus isolated requires to be purified by washing with water, dissolving in a dilute acid, and freeing from coloring matter by animal charcoal; ammonia will then precipitate veratrine as a white powder.

The concentrated alcoholic extract may also be deprived of its alkaloidal constituents by boiling with acidulated water, and the acid solution decomposed by magnesia, the excess of which remains with the liberated alkaloids; the latter are taken up by alcohol combined with sulphuric acid, the alcohol evaporated, the remaining aqueous solution decolorized by animal charcoal, and the veratrine precipitated by ammonia. This was the process of the U. S. P. 1870.

The outlines of the process of the French Codex are as follows: Exhaust with alcohol acidulated with sulphuric acid, add slaked lime to the tincture to liberate the alkaloids, filter from the calcium compounds, distil off the alcohol, dissolve the residue in dilute sulphuric acid, decolorize by means of animal charcoal, precipitate by ammonia, again dissolve in alcohol, and repeat the treatment as before; finally, dissolve the washed and dried veratrine in ether, filter, and evaporate spontaneously.

Several other processes have been recommended for the preparation of veratrine, in which advantage is taken of its ready solubility in acidulated water. Delondre (1855) exhausts the powdered seeds by percolation with water acidulated with hydrochloric acid, precipitates with potassa, and exhausts the washed and dried precipitate with ether, on the evaporation of which the alkaloid is left behind. Merck's process is somewhat similar: powdered sabadilla is boiled with very dilute hydrochloric acid, the solution concentrated to a syrupy consistence, and further acidulated with hydrochloric acid as long as a precipitate of veratric acid appears. The filtrate is precipitated with lime; the precipitate is collected and exhausted with alcohol; the alcohol is distilled off, and the residue dissolved in dilute acetic acid. On the addition of ammonia, veratrine is precipitated; it is obtained as a crystalline powder by dissolving it in ether and evaporating, as directed by the French Codex.

Properties.—As obtained by the first process, veratrine is a white or whitish amorphous powder, permanent in the air, without odor, powerfully sternutatory, and very irritating to the nostrils, and has a persistently acrid taste, "leaving a sensation of tingling and numbness on the tongue" (*U. S.*). It imparts to water an acrid taste, but requires about 1000 parts of boiling water for solution, the excess of the alkaloid cohering in lumps without melting. It has an alkaline reaction to test-paper, neutralizes acids, and when heated melts, and afterward is decomposed, forming a spongy charcoal, and is finally dissipated without leaving any residue. Veratrine is soluble in 3 parts of alcohol and dissolves in about 6 parts of ether (Delondre), in 1.6 (Pettenkofer) or 8.6 (Schlimpert), or 2 (*U. S.*) parts of chloroform; in 96 parts of glycerin (Cap and Garot) and 56 parts of olive oil (Pettenkofer). Nitric acid imparts to veratrine a yellow color or forms a reddish-yellow solution. Its solution in concentrated hydrochloric acid acquires by heat a deep-red color, which remains unaltered for several weeks (Trapp, 1862). Sulphuric acid dissolves veratrine with a yellow color, changing in a few minutes to orange-red, then to blood-red, in about thirty minutes to carmine-red, and subsequently to violet color (Henry). Masing (1869) observed that .00017 Gm. of veratrine may be detected with the last two tests, but that the reaction with hydrochloric acid is less interfered with by the presence of extractive matter. The fresh solution of veratrine in sulphuric acid becomes at once purple-colored on the addition of bromine-water. "On triturating 1 part of veratrine with 100 parts of sulphuric acid, the solution shows a green-yellow fluorescence, the color gradually changing to red" (*P. G.*). The U. S. P. directs for this test no definite quantity of sulphuric acid, but states that the fluorescence first observed becomes more intense on adding more sulphuric acid. On sprinkling powdered sugar upon a thin layer of the solution of veratrine in sulphuric acid, a yellow color is produced, changing to green and blue, and becoming paler after an hour (Weppen, 1874).

Tests.—The tests just described establish the identity of veratrine. On being ignited upon platinum-foil no residue should be left.

Composition.—The formula $C_{32}H_{52}N_2O_8$ is that ascertained by Merck for the crystalline alkaloid in large colorless, rhombic prisms, which on exposure become white, opaque, and friable, and lose their shape in boiling water without melting or dissolving. The crystals are obtained by dissolving medicinal veratrine in alcohol, adding water until a permanent precipitate begins to appear, and evaporating spontaneously; the residue will consist of crystals imbedded in a brown amorphous, resin-like mass, which is removed by cold alcohol, after which the crystals may be purified by recrystallizing from strong alcohol. Weigelin (1871) ascertained that veratrine exists in two distinct modifications, one of which is soluble in water, and by heating the solution is converted into the insoluble variety, which has a resinous appearance; analysis led to the composition $C_{52}H_{86}O_2N_{15}$.

According to E. Schmidt (1877), commercial veratrine contains three distinct modifications—namely, a crystalline base soluble in water, and two amorphous bases, one of which is soluble, the other insoluble, in water. The crystalline base predominates, and is regarded by Schmidt as veratrine proper; he gives it the formula $C_{32}H_{50}NO_9$; its platinochloride was found to be easily soluble in alcohol, less soluble in water, and insoluble in ether. The amorphous modifications appear to have the same formula, which differs from that given by Merck chiefly in the amount of nitrogen.

On treating medicinal veratrine with ether, a residue is left from which Couërbe (1834) isolated a second crystallizable alkaloid, *sabadilline*, for which Weigelin gives the formula $C_{41}H_{66}N_2O_{13}$. It is not sternutatory, and dissolves more or less freely in water, benzene, petroleum benzin, amylic alcohol, and chloroform; neutralizes the acids completely, but yields amorphous gum-like salts with sulphuric and hydrochloric acid, which are not precipitated by alkalies or their carbonates, and yield but slight precipitates with phosphotungstic acid and potassio-cadmium iodide. That portion of medicinal veratrine which is soluble in ether yields to hot water, in which veratrine is insoluble, a third alkaloid, which Weigelin named *sabatrine*, and found to have the composition $C_{51}H_{86}N_2O_{17}$. It is likewise soluble in benzene, petroleum benzin, amylic alcohol, and chloroform, is amorphous and yields amorphous salts, which are precipitated by hot potassium hydroxide and carbonate if not added in excess.

The most recent investigation on the sabadilla alkaloids was made by C. R. A. Wright and A. P. Luff (1878), who were unable to find sabadilline. They regard sabatrine as an alteration-product. They retain the name *veratrine* for the amorphous alkaloid of medicinal veratrine, and deny the existence of isomeric modifications; they give it the formula $C_{37}H_{53}NO_{11}$, and state that on saponification it splits up into veratric acid and a new base, *verine*, $C_{28}H_{45}NO_8$. Merck's crystallizable base is named by them *cevadine*, and is stated to have the composition $C_{32}H_{49}NO_9$, and, on saponification, to be resolved into a new base, *cerine*, $C_{27}H_{43}NO_8$, and the cevadic acid of Pelletier and Caventou, which is methyl-crotonic acid, $C_5H_8O_2$. The third alkaloid, *cevadilline*, $C_{34}H_{53}NO_8$, is insoluble in ether, is probably identical with sabadilline, but separates in an amorphous condition from benzene, and on saponification yields methyl-crotonic acid and the base *cevilline*. 20 pounds of sabadilla-seeds yielded between 60 and 70 Gm. of mixed alkaloids.

It will be observed that medicinal veratrine is a mixture of two or three alkaloids naturally existing in sabadilla, and of several derivatives from these alkaloids.

Action and Uses.—Veratrine has a bitter and acrid taste, and the least portion of it placed upon the tongue produces a peculiar and persistent numbness and tingling, with irritation of the throat and salivation. The minutest quantity of it introduced into the nostrils, and even the casual approach of a vial containing it to the nose, occasion protracted irritation and sneezing, and sometimes coughing. Applied in alcoholic solution or in an ointment to the sound skin, it produces a slight prickling sensation, and upon very delicate portions of the integument a pain compared to that which might be occasioned by its puncture with hot needles. The pain, however, is transient, and is followed by a sense of coolness and numbness. If the preparation is strong and is applied with friction, an eruption of vesicles may follow. If well rubbed in, particularly upon the face, slight twitching of the muscles is sometimes observed, and, more rarely, formication, which extends to remote parts of the body. Applied to the denuded skin or injected hypodermically, it causes severe pain, muscular twitching, and the other ordinary effects of its internal administration. These effects vary with its dose. Gm. 0.001–0.003 (gr. $\frac{1}{60}$–$\frac{1}{20}$) occasion tingling which begins in the fingers and toes, and thence extends to the whole body, followed by a sense of numbness in the same parts and more or less lowering of the pulse. If the usual limit of medicinal doses is exceeded, and Gm. 0.003–0.006 (gr. $\frac{1}{20}$–$\frac{1}{10}$) of the alkaloid or of its acetate is taken, there may occur great faintness and pallor; increased frequency, irregularity, and weakness of the pulse; nausea and vomiting, usually of bilious liquids; diarrhœa, sometimes with bloody stools; cold sweating and muscular twitching; and aching along the spine. If the dose is repeated at intervals, the gastro-intestinal symptoms subside, but the pulse falls considerably below the normal rate. There is also a good deal of irritation and constriction of the fauces, with secretion of mucus.

A woman who swallowed about Gm. 0.20 (3 grains) of veratrine in a liniment containing chloric ether and opium was affected with giddiness, faintness, nausea, thirst, diarrhœa, tenesmus, and constriction of the abdomen; the tongue was swollen, the mouth and throat sore, the pupils contracted, the breathing hurried, the pulse small and quick, the action of the heart feeble. There was extreme itching of the skin which lasted for

several days, a tingling which did not cease for two months, and a peculiar spasmodic snapping of the lower jaw (*St. George's Hosp. Rep.*, v. 69).

Veratrine was used first internally as a remedy for *neuralgia*, and in the most obstinate form of that affection, *sciatica*, which so often depends upon material alterations of structure. It is now very seldom given internally in this or any other variety of neuralgia, but is of common use as a topical application in the functional forms of the affection. Although inferior for this purpose to aconitine, it is nevertheless efficient in many cases of neuralgia of the fifth pair, of the intercostal nerves, and others. Very probably it acts both by obtunding the sensibility of the painful part and by its counter-irritant operation upon the skin when it is applied in due strength directly to the sensitive points of the nerve. It is sometimes injected hypodermically, Gm. 0.01 ($\frac{1}{6}$ grain) at a time, but an application of the officinal ointment of veratrine is preferable. It is rendered much more efficient by the addition to each drachm of it of 2 or 3 grains of morphine hydrochlorate or sulphate. In various forms of *pruritus* the topical use of veratrine is an efficient palliative. It may be given internally with advantage when the itching is general (Chéron, *Med. News*, xlvii. 268).

In the treatment of *acute articular rheumatism* this medicine has been systematically employed, by beginning on the first day of the treatment with a single dose of Gm. 0.005 (gr. $\frac{1}{12}$), and on each successive day giving an additional dose until the sixth or seventh day, unless the disease sooner yielded or the toxical effects of the medicine were developed. In the latter case it was suspended or its dose diminished. It was claimed for this treatment that it speedily reduced the fever and subdued the pain of the disease, and that in a patient of unimpaired constitution it frequently triumphed over an acute attack of the disease in a week. It was further asserted that it did not, like copious bloodletting, exhaust the patient's strength and develop anæmia. This advantage over the older sanguinary method may be admitted, but there is not a shadow of evidence to demonstrate its power of shortening an attack of rheumatism, or, above all, of preventing the most serious of the ordinary complications of the disease, inflammation of the heart and its membranes. Indeed it is seldom employed at present, and those who imagine that the cure of rheumatism consists in repressing certain of its symptoms find in the preparations of green hellebore equally efficient and less dangerous agents. The same remark is literally applicable to the use of veratrine in *pneumonia*. The strongest reason that could be found by an eminent therapeutist for employing veratrine in this disease was that "the results from its use appear to be comparable to those of the antimonial treatment" (Trousseau). But since the latter is one of the most mischievous that was ever employed, the merit of the former may be duly estimated. If some will use this medicine as they would green hellebore, digitalis, aconite, etc. in febrile affections, they must be prepared with diffusible stimulants to combat its sedative effects when they grow alarming.

Veratrine has occasionally been used to allay disordered action of the *heart* in acute and also in chronic diseases of that organ, and it may sometimes become a useful palliative of this distressing symptom, and thereby even avail to diminish cardiac dropsies. But for such purposes other preparations of veratrum are preferable. It is unnecessary to discuss its virtues in eruptive fevers or in typhoid fever, for which it has sometimes been prescribed, or in nervous affections, such as whooping cough, chorea, hysteria, nervous tremor, and functional paralysis, or to do more than state the fact of its having been employed topically to reduce enlarged glands, scrofulous swellings of joints, etc. It is sufficient to say that Liebermeister (*Handbuch des Fiebers*, S. 643), even while advocating its use, warns against giving it to persons with a feeble heart, and, while admitting that it may produce collapse, claims that food and alcohol will rescue the patient from that peril. It is alleged by Féris that various *tremors*, including those due to alcohol, fever, nervous degeneration, etc., are benefited by veratrine in doses of Gm. 0.0005 (gr. $\frac{1}{120}$) three or four times a day (*Practitioner*, xxxii. 212). The statement seems highly improbable.

Owing to its very acrid taste, veratrine is generally given internally in pilular form in doses varying from Gm. 0.0016–0.016 (gr. $\frac{1}{40}$–$\frac{1}{4}$). The dose should be rapidly but cautiously increased from the minimum until nausea or slowing of the pulse occurs. Externally the officinal ointment is a convenient preparation for application by friction, which should be made with a mop or with the finger guarded by a glove, and until a feeling of burning or prickling is perceived by the patient. Solutions in oil and glycerin may be applied in the same manner. For endermic use Gm. 0.008–0.033 (gr. $\frac{1}{8}$–$\frac{1}{2}$), mixed with starch, may be prescribed. Hypodermically, Gm. 0.01 (gr. $\frac{1}{6}$) may be

employed at a single operation, but the method is objectionable on account of the pain it occasions and the probability of abscess being caused by it. In *poisoning* by veratrine the stomach should first be evacuated, then washed with a solution of tannin, and the sedation combated with alcohol, ammonia, electricity, artificial respiration, etc.

Tulipine, an alkaloid derived from the common tulip, is said by Dr. Ringer to be a muscle-poison, like veratrine, although weaker. It paralyzes either the cord or the afferent nerves, or both; its action on the motor nerves, if any, is slight; it affects the heart of frogs like veratrine, and does not affect the pupil (*Practitioner*, xxv. 241).

VERATRUM ALBUM.—White Veratrum (Hellebore).

Rhizoma veratri, P. G.; *Radix hellebori albi.*—*Vératre* (*Hellébore*) *blanc*, Fr.; *Weisse Nieswurzel*, *Weisser Germer*, G.; *Vedegambre* (*Eléboro*) *blanco*, Sp.

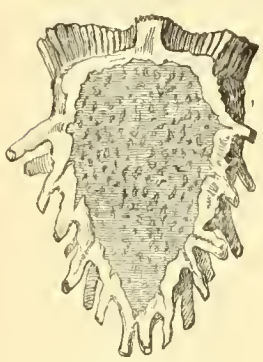
The rhizome (*F. Cod.*), with the rootlets (*P. G.*), of Veratrum album, *Linné*. Bentley and Trimen, *Med. Plants*, 285.

Nat. Ord.—Melanthaceæ.

Origin.—Veratrum album is an herbaceous perennial growing in moist meadows of the Pyrenees and Alps and eastward throughout Russia, Siberia, Northern China, and Japan. It has likewise been found in Colorado and in other parts of Western North America (Ver. californicum, *Durand*). The stem is .6–1.2 M. (2 to 4 feet) high, and has numerous alternate elliptic or broadly oval, entire leaves, which are about 15 Cm. (6 inches) long, strongly ribbed and plicate, and sheathing at the base; the upper ones are smaller, narrower, and lanceolate in form. The inflorescence is a large racemose panicle 30–45 Cm. (12 to 18 inches) long, with polygamous flowers having six spreading lance-oblong, yellowish-white, and externally green sepals. The three-horned fruit consists of three partly-united follicles containing numerous flattened and winged seeds. The rhizome is collected in autumn. The variety viridiflorum, *Mertens et Koch* (Ver. Lobelianum, *Bernhardi*), grows in Europe, and differs chiefly in the more simple inflorescence, the longer bracts, and the pale-green flowers.

Description.—The rhizome of white veratrum is upright, obconical in shape, simple or occasionally divided above into two branches; it is 5–8 Cm. (2 to 3 inches) long, and about 25 Mm. (1 inch) thick, tufted above with the remnants of the leaf-bases, truncate below, the lower half beset with dead and the upper portion with yellowish fleshy nearly simple rootlets, which shrink considerably in drying, and are 20–30 Cm. (8 to 12 inches) long and about 2 Mm. ($\frac{1}{12}$ inch) thick. In the commercial drug the rootlets were formerly often cut off close to the rhizome, and this has been occasionally divided to facilitate the drying. The rhizome is somewhat annulate, externally of a dull black-gray color, and either closely surrounded with rootlets or tuberculated from the root-remnants; internally it is whitish or grayish-white, and shows upon transverse or longitudinal section, at a distance of about 3 Mm. ($\frac{1}{8}$ inch) from the outer surface, a brownish wavy nucleus-sheath, and in the inner portion numerous small wood-bundles, which are scattered, irregularly curved in various directions, and rather crowded near the nucleus-sheath; outside thereof only a few small wood-bundles are seen passing into the rootlets. The nucleus-sheath consists of one or occasionally two rows of cells, having the inner cell-walls much thickened; the parenchyma-cells are filled with small starch-granules or a few of them with raphides of calcium oxalate. The drug is inodorous, but its dust is strongly sternutatory; its taste is bitter and burningly acrid.

Fig. 314.



Veratrum album, *Linné*: longitudinal section of rhizome.

Constituents.—Pelletier and Caventou (1820) obtained from white veratrum liquid and solid fat, a volatile acid, gum, starch, and an alkaloid, which they declared to be identical with veratrine, and to be combined with gallic acid. The existence in veratrum of gallic acid was, however, denied by Pfaff and by Weigand (1841). The latter found in it about 10 per cent. of pectin. E. Simon (1838) announced the isolation of a second alkaloid, *jervine*, $C_{30}H_{46}N_2O_3$. After Charles Bullock (1865) had proved the non-existence of veratrine in Veratrum viride, Dragendorff (1872) announced its absence also from white veratrum; and this observation was corroborated by C. L. Mitchell (1874), who found in it, besides jervine, a second alkaloid, which he named *veratralbine*. Wright and Luff (1879) announced the presence in 1 kilogram of white veratrum of 4.20 Gm. of alka-

loids, of which 1.30 is jervine, $C_{26}H_{37}NO_3$, 0.40 pseudojervine, $C_{29}H_{43}NO_7$, 0.25 rubijervine, $C_{26}H_{43}NO_2$, 2.20 veratralbine, $C_{28}H_{43}NO_5$, and 0.05 another sternutatory base, probably veratrine.

Jervine, when pure, is a white powder, crystallizes from alcohol, is tasteless, not sternutatory, insoluble in water and ether, soluble in alcohol and chloroform, and melts between 198° C. (Bullock) and 237° C. (Wright). Its salts with acetic and phosphoric acids are soluble in water, and these solutions are precipitated by sulphuric, hydrochloric, and nitric acids and their soluble salts. According to Bullock (1875), its acetic acid solution, treated with potassium nitrate, affords a ready method for obtaining the alkaloid in a pure state. Sulphuric acid colors jervine yellow, changing to green, and finally to turbid yellow; on the addition of bromine the green color changes to a faint brownish tint. The other color reactions (yellow by nitric or boiling hydrochloric acid) are not very characteristic.

Pseudojervine, like jervine, dissolves in strong sulphuric acid with a yellow color, the solution gradually turning green; its sulphate is tolerably soluble in water. The alkaloid melts at 299° C., and is insoluble in ether.

Rubijervine is soluble in ether, melts at 237° C., is colored red by sulphuric acid, forms a readily soluble sulphate, and is not sternutatory.

Veratralbine is white, unerystallizable, bitter, burningly acrid, and violently sternutatory. It dissolves in alcohol, amylic alcohol, ether, chloroform, carbon disulphide, and in dilute acids, forming soluble and unerystallizable salts. It melts near 170° C. (338° F.) and sublimes in small feathery crystals. In its behavior to reagents it closely resembles *veratroidine*, and is regarded by Tobien (1877) as being identical with it. According to Wright and Luff, pure veratralbine is not sternutatory.

Weppen (1872) could not find Weigand's pectin, and leaves it undecided whether the presence of that compound is due to an adulteration or to the period at which the rhizome had been collected. Pelletier and Caventou's gallic acid was recognized as a new acid, called jervic acid, and the coloring matter as *veratramarin*, a light-yellow, very bitter, and deliquescent neutral principle, which is present in very minute quantity, so that 60 pounds of the rhizome yielded a quantity insufficient for a thorough chemical investigation. Veratramarin is easily soluble in water and alcohol, insoluble in ether, benzene, chloroform, and petroleum benzin, and is precipitated from its solutions by lead subacetate and tannin.

Jervic acid, $C_{14}H_{10}O_{12}.2H_2O$, is a white crystalline powder, has an acid taste, is insoluble in benzene, carbon disulphide, chloroform, petroleum benzin, and amylic alcohol, is very sparingly soluble in absolute alcohol and ether, and requires more than 100 parts of cold water for solution. The acid is neither fusible nor sublimable; its silver salt crystallizes from the solution in hot water, is insoluble in dilute nitric acid, and is not altered on exposure to light.

Dr. Jos. Waltl (1828) considered the rhizome, with the rootlets attached, to be more active than the rhizome alone, and Schroff (1860) announced the rootlets to have a more powerful action than the rhizome, and somewhat different from it.

Action and Uses.—When taken internally in poisonous doses it occasions soreness of the mouth and swelling of the tongue, burning heat in the stomach, vomiting, anxiety, tremor, vertigo, weakness of the limbs, aphonia, interrupted respiration, syncope, a feeble pulse, convulsions, sinking, distortion of the eyes, dilated pupils, blindness, mental aberration, prolonged insensibility, and cold sweating. Among these symptoms purging is not mentioned, but it occurs under the prolonged use of the drug. When death has resulted directly from poisonous doses, signs of active gastro-intestinal inflammation and congestion of the lungs have been found. In poisoning with recovery there have been observed for several days debility, tremulousness, muscular twitching, and a sense of constriction and distress in the præcordial region.

White hellebore is now hardly used as an internal medicine. Externally, it has been applied in decoction to destroy *vermin* in man and beast and for the relief of *pruritus vulvæ*. It was formerly employed in the treatment of *itch*. Its irritant properties caused it to be used as an *errhine* when diluted with starch or some other inert powder or with snuff. In this way it is sometimes made use of to relieve the frontal headache which occurs in certain cases of *coryza*. If it is administered internally, the commencing *dose* should not exceed Gm. 0.06–0.12 (gr. j–ij).

VERATRUM VIRIDE, *U. S.*—Veratrum Viride.

Veratri viridis rhizoma (*radix*), Br.—*American or Green veratrum* (*hellebore*), *Indian poke*, E.; *Vératre vert*, Fr.; *Grüner Germer*, G.; *Vedegambre verdo*, Sp.

The rhizome and rootlets of Veratrum viride, *Solander* (Ver. album, var. viride, *Baker*, Melanthium virens, *Thunberg*). Bentley and Trimen, *Med. Plants*, 286.

Nat. Ord.—Melanthaceæ.

Origin.—Green veratrum grows in swampy places and on the borders of damp thickets in Canada, and in the United States as far south as Georgia. It resembles the white veratrum so closely that no important botanical difference between them can be ascertained, and Asa Gray remarks that it is "much too near Veratrum album of Europe." It more especially resembles the green flowering variety Lobelianum, and Regel (1861) regarded it as identical with a variety growing in Eastern Siberia. Its flowers are yellowish-green and appear in June. The rhizome is collected in autumn.

Description.—The rhizome agrees in size, shape, color, taste, and structure so closely with that of white veratrum that it is difficult, if not impossible, to distinguish the two drugs if they have been trimmed alike. The American veratrum is nearly always dried with the rootlets attached, and these are from 10–25 Cm. (4 to 10 inches) long, abou' 2 Mm. ($\frac{1}{12}$ inch) thick, much shrivelled, and of a light yellowish-brown color; those on the lower part of the rhizome, if present, are thinner and black. We have occasionally found considerable portions of the leaf-stalks and stems present in the commercial drug; these parts appear to be inert or nearly so, and should be rejected.

Constituents.—H. W. Worthington (1838) isolated an alkaloid from green veratrum which he regarded as identical with veratrine. The same conclusion was arrived at by J. G. Richardson (1857) and by G. J. Scattergood (1861). But Charles Bullock (1865) proved that American veratrum contains two alkaloids, neither of which is identical with veratrine. These alkaloids were subsequently named by Prof. G. B. Wood *viridine* (insoluble in ether) and *veratroidine* (soluble in ether). E. Puegnet (1872) recognized the so-called viridine as impure *jervine*, and C. L. Mitchell (1874) made the same observation. In the same year Mitchell characterized *veratroidine* as follows: It is a white uncrystallizable powder of a bitter taste, leaving a tingling sensation in the fauces, violently sternutatory, and extremely irritating. It fuses near 130° C. (265° F.), is soluble in alcohol, amylic alcohol, ether, chloroform, carbon disulphide, and when freshly precipitated slightly in petroleum benzin. It forms soluble salts with the acids, most of which are uncrystallizable. Sulphuric acid colors it yellow, changing to dark-red. Boiling hydrochloric and nitric acids color it yellow. Tobien's (1877) elementary analysis leads to the formula $C_{51}H_{78}N_2O_{16}$ or to $C_{24}H_{37}NO_7$. He obtained both jervine and veratroidine also from the rhizome and the young leaves of Veratrum lobelianum, and found in the dried rhizome of Veratrum album but little jervine and a larger quantity of veratroidine. C. A. Robbins (1877) announced that he had isolated from American veratrum, besides jervine, another crystallizable alkaloid, which is soluble in ether, and which produces with sulphuric acid and sugar a yellow color changing to blue, and with sulphuric acid a yellow color quickly changing to a pink-red, and after several hours to indigo-blue; presence of jervine or of coloring matter prevents the appearance of the blue color. Bullock (1879) obtained 0.66 per cent. of mixed alkaloids; Wright and Luff (1879) only 0.08 per cent., that portion remaining with the resins probably escaping their notice. The latter investigators consider over one-half of the alkaloids to be cevadine (see Veratrina), one-fourth to be jervine, nearly one-fifth to be *pseudojervine*, and the remainder *rubijervine*, while less than 0.0004 per cent. is regarded by them as *veratrine*, the presence of which, besides jervine, in both the American and white veratrum was announced by Prof. Wormley in 1876. Bullock, however, obtained fully two-thirds of the alkaloids as nitrate of jervine, the remainder being Wright's rubijervine, with probably some pseudojervine. (See Veratrum Album.)

In the investigations recorded above no notice has been taken of the probable difference in the composition of the rootlets and rhizome, as suggested by Prof. Schroff. The rhizome of American, like that of the white veratrum, contains considerable resin, from which the alkaloids are not easily purified.

Action and Uses.—The greater number of reports which have been published concerning the medicinal uses of green veratrum are, unfortunately, not only deficient in the details on which a judgment could securely rest, but exhibit great ignorance of the natural history of disease and of the relation of medicines to its cure. There are many

reporters who attribute to this medicine equal curative virtues in asthenic and sthenic diseases, in *inflammations* (*pneumonia*), and in fevers (*typhoid fever*), and not a few who extol its virtues when it forms only one of several active agents simultaneously administered to the patient. The only conclusion to be drawn from a critical study of the mass of conflicting evidence respecting its use in the diseases referred to is, that the patients would have been better off not only without its use, but also without that of the medicines associated with it. The suggestion has been made that the effects of veratrum viride and of depletion are so similar that the drug may serve as a substitute for that operation; upon which it may be remarked that the condemnation of venesection *upon scientific grounds* has been so general and complete that to advocate a medicine on account of its supposed analogy to depletion is not to recommend it. Nor should it be forgotten that this identical reason was at one time urged in favor of substituting digitalis for depletion. Now, veratrum viride and digitalis are physiological antagonists. But venesection does much more than reduce the pulse-rate in inflammatory affections (and, indeed, in comparison with green veratrum, its action is in this respect very insignificant): it takes away from the blood a portion of the solids which sustain the inflammatory process, and supplies their place with water; it also removes from the system a portion of the effete matters produced by inflammation and which tend to convert the circulating fluid into a poison. The artificial production of perspiration by veratrum or by any other medicine does not accomplish this purpose. It may occasion a profuse discharge of water, and so far may diminish the amount of liquid in the blood-vessels; but there is no reason to believe that it removes the "materies morbi," the "peccant matter," associated with the disease materially and essentially. If it were really curative in this manner, then jaborandi and pilocarpine ought to be the most efficient remedies for fevers and inflammations; which is not claimed in their behalf. The only plausible grounds for its use in pneumonia are more theoretical than practical. What has been observed of its effects in acute *rheumatism* is true of other febrile diseases. As expressed by Boulter (*St. Bartholomew's Hosp. Rep.*, xv. 164), "veratrum viride has little or no effect in reducing the temperature in rheumatic fever; the pains subside no more quickly (?) than under other ordinary modes of treatment; it has no power of warding off cardiac complications; and its only effect—which, however, only takes place in some cases—is to depress the vascular system, as shown by the slowness and irregularity of the heart's action." Cardiac sedatives, of which the medicine under consideration is the type, tend to retain in the blood all that is injurious in it, and at the same time reduce the patient to a state of such wretchedness that he is unable to take food, or to digest it if he eats it, or even to find energy enough to cling to that last refuge of sufferers, hope.

There is but one class of acute cases in which the utility of this medicine is presumable —cases of imminent or *commencing congestion* or *inflammation*, in which the maintenance of its sedative action on the heart for a short period would allow the conservative powers of the system to operate within normal limits (tonsillitis, pleurisy, pneumonia). This statement also applies to certain *wounds* which tend to dangerous results, like those of the head, pericardium and heart, and peritoneum. The comparative immobility in which the inflamed parts are maintained by the infrequent arterial movement may favor their cure. In some cases of organic *heart disease*, as well as of *nervous palpitation*, including *exophthalmic goitre*, this medicine is reported to have afforded great relief, probably by allowing the heart sufficient rest for recovering its power (*Bull. et Mém. Soc. ther.*, 1889, p. 175). It would certainly be unsuited for the treatment of cardiac affections depending upon absolute debility of the organ. It has been used with apparent benefit in *puerperal mania*, *puerperal convulsions* (*Therap. Gaz.*, xi. 675; *Canadian Practitioner*, March, 1885), *epileptiform convulsions*, *tetanus*, *chorea*, and *mania-a-potu*. In a case of persistent *priapism* affecting only the corpora cavernosa, and after failure to reduce it by means of many medicines, including tartar emetic, belladonna, and potassium bromide, the penis began to be relaxed as soon as veratrum viride had reduced the pulse to 50 (Walker, *Amer. Jour. Med. Sci.*, Apr. 1877, p. 565). It will be observed that nearly all of the acute affections in which the medicine has been most unequivocally useful were marked by nervous, and not febrile, excitement; in other words, they were amenable to it as a sedative of the nervous and not of the circulatory system. Remarkable results have been attributed to the sedative influence on the pulse-rate of veratrum viride in *diphtheria*. But since in the series of cases which led to this judgment there were used, besides green veratrum, applications of Monsel's salt, internally potassium chlorate and sublimed sulphur and calomel, and also external applications of "kerosene oil

or some other irritant" (*Med. Record*, xxxiii. 627), the utility of white hellebore in diphtheria cannot be considered as proven by them, and analogy does not render it probable.

Externally, the tincture is used as a discutient and anodyne.

The proper remedies in *poisoning* by this drug are diffusible stimulants, and especially alcohol, which should be given by the rectum if the patient vomits. Its efficacy is shown by the case of a physician who took an ounce of the tincture at one draught; so completely did the alcohol counteract the green veratrum of the preparation that except nausea, vomiting, and some dyspnœa no evil results followed (*N. Amer. Med.-Chir. Rev.*, ii. 930). Besides alcohol, ammonia may be administered, and sinapisms should be applied over the heart, while stimulant (that is, small and repeated) doses of some liquid preparation of opium may be administered. During the treatment the patient's head should be kept as low as his body, or even lower.

Green veratrum may be administered in powder in the *dose* of Gm. 0.12 (gr. ij), but the liquid preparations are more eligible. Of these the fluid extract and the tincture are officinal; the dose of the former is from Gm. 0.05–0.15 (1 to 3 minims), and of the latter from Gm. 0.20–0.40 (4 to 8 minims). They should be given at intervals of about three hours. Their tendency to cause vomiting may be prevented by the administration of from 5 to 10 drops of deodorized laudanum ten or fifteen minutes before each dose. As soon as the pulse begins to fall the dose should be diminished. Females and growing persons ought not to take doses exceeding two-thirds of those mentioned, and for children from one to five years old a sufficient quantity is Gm. 0.06 (gtt. j) of the tincture. Gm. 0.60–1 (♏x–xv) of tincture, largely diluted with water, have been administered hypodermically.

VERBASCUM.—Mullein.

Bouillon-blanc, *Molène*, Fr. Cod.; *Wollkraut*, *Königskerze*, G.; *Gordoloba*, Sp.

The leaves and flowers of Verbascum Thapsus, *Linné* (V. Schraderi, *G. Meyer*). *F. Cod.*; the corolla of V. phlomoides, *Linné*, and V. thapsiforme, *Schrader* (V. Thapsus, *G. Meyer*), *P. G.*

Nat. Ord.—Scrophulariaceæ.

Origin.—The genus Verbascum consists of tall, more or less woolly, biennial or perennial herbs, with the flowers in dense spikes or paniculate racemes. The flowers have a five-parted calyx, a wheel-shaped somewhat unequally five-lobed corolla, five more or less woolly stamens, and a two-celled, two-valved, and many-seeded capsule. Three species have been naturalized in North America—Verb. Blattaria, *Linné*, V. Lychnitis, *Linné*, and V. Thapsus, *Linné*—having the leaves respectively nearly smooth on both sides, tomentose on the lower surface, and densely woolly on both sides.

Description.—Folia verbasci. The leaves are from 10–20 or 30 Cm. (4 to 8 or 12 inches) long, the upper ones sessile on the stem, and all decurrent. They vary in shape between elliptic, oblong, and oval-lanceolate, are acute, more or less crenate on the margin, and densely covered with soft whitish stellate hairs. The leaves are nearly inodorous and have an insipid, mucilaginous, faintly bitter taste.

Flores verbasci. The calyx is rejected, and only the corolla with the adhering stamens is preserved. The wheel-shaped corolla is 25–38 Mm. (1 to 1½ inches) broad, bright-yellow, smooth above, and stellately tomentose beneath, has five obovate roundish lobes about 15 Mm. (⅗ inch) long, and bears in the short tube the stamens, of which the three upper ones have reniform anthers and the filaments covered with a white wool; the two lower stamens are longer and smooth and have elongated decurrent anthers. V. Thapsus has the corolla only about 12 Mm. (½ inch) broad, and the lower stamens with long filaments. V. Lychnitis and V. Blattaria have the anthers reniform upon equal filaments, which are white-woolly in the former and purple-woolly in the latter species. To preserve their bright color the flowers should be thoroughly dried and kept in a dry and well-stoppered bottle; if permitted to become damp they acquire a blackish color. The flowers have a slight, agreeable, honey-like odor and a mucilaginous and sweet taste.

Constituents.—The leaves and flowers contain mucilage. Morin (1826) obtained from the flowers a trace of yellowish volatile oil, a fatty substance, sugar, and coloring matter which is insoluble in ether and cold water and yields in alcoholic solution a yellow precipitate with lead acetate.

Action and Uses.—The chief medicinal constituent of this plant is the mucilage

furnished by its leaves, but its flowers contain an essential oil in small proportion, to which the agreeable odor of the fresh plant and its slight stimulant qualities are due. Fish are said to become stupefied by eating the seeds. The infusion of mullein is useful in catarrhal affections of the *respiratory organs*, and in Ireland is in popular use to palliate *cough* and *diarrhœa*. For this purpose it should be boiled with milk. It is much used in the country mentioned to relieve the cough of *phthisis*. It is recommended in irritations of the *urinary bladder*. It may be used in enema for *dysentery*. It is said, but without sufficient evidence of the assertion, that it has cured *intermittent fever*. A poultice made with the leaves boiled in milk is a convenient application to inflamed *hæmorrhoids*. Olive oil saturated with mullein-flowers during prolonged exposure to the sun, or kept near a fire for several days in a corked bottle, is a popular preparation in Germany for *bruises*, *frost-bite*, and irritable *piles*. The infusion should be made of the fresh leaves and flowers, if possible, in the proportion of Gm. 32 to Gm. 500 (℥j to Oj) of boiling water. When cool it should be strained to free it from the irritating hairs which cover the leaves.

VERONICA.—Speedwell.

Véronique mâle, Fr.; *Ehrenpreis*, G.; *Veronica*, Sp.

Veronica officinalis, *Linné*.

Nat. Ord.—Scrophulariaceæ.

Origin and Description.—The common speedwell is distributed over a considerable portion of the northern hemisphere, and grows in grassy places and open woods. It is a procumbent pubescent perennial with ascending branches and with opposite, short-petiolate, obovate, or elliptic and coarsely crenate or serrate, grayish-green leaves, which are about 25 Mm. (1 inch) long. The flowers are in one or two axillary racemes on the upper part of the branches, are on short pedicels, and have a wheel-shaped four-parted pale-blue corolla with dark-blue stripes and two exserted stamens. The fruit is an inversely heart-shaped, two-celled capsule. The fresh herb is faintly aromatic; after drying it is inodorous and has a bitterish and slightly astringent taste.

Constituents.—Speedwell contains a little tannin and a bitter principle.

Allied Species.—Veronica Beccabunga, *Linné*.—Brooklime, *E.*: Beccabunga, Cressonée, *Fr.*: Bachbungen, *G.*—It grows in Europe and Asia near springs and in brooks, and has an ascending smooth stem, with opposite, short petiolate, oval or oblong, crenate-serrate, obtuse, and smooth leaves, about 38 Mm. (1½ inches) long, and with axillary loose racemes of pale-blue and veined flowers. It is used in the fresh state (*F. Cod.*).

Ver. americana, *Schweinitz*, resembles the preceding, but has petiolate, ovate, acutish, and often slightly heart-shaped leaves.

Brooklime is inodorous, and has a bitterish, somewhat saline, and slightly pungent taste.

Action and Uses.—Veronica is bitter, astringent, and slightly aromatic, in which qualities it resembles hoarhound and several other plants which, like it, have been used in the treatment of chronic *bronchitis*. Its decoction has been applied externally in *scabies*, papular *cutaneous eruptions*, and *ulcers*, and given internally in *urinary* and *calculous disorders*. V. Beccabunga is regarded as antiscorbutic and diuretic, and is said to be slightly stimulant and tonic. It has been employed in chronic affections of the skin, in scrofula, and in scurvy, both internally and topically. It is reported that V. parviflora (*Koroniko*), a New Zealand plant, is very efficient in the treatment of chronic dysentery (*Practitioner*, xxix. 300).

VIBURNUM OPULUS, *U. S.*—Viburnum Opulus (Cramp-bark).

Cranberry-tree bark, E.; *Ecorce d'obier*, Fr.; *Wasserholderrinde*, G.

The bark of Viburnum opulus, *Linné*.

Nat. Ord.—Caprifoliaceæ.

Origin.—This species is indigenous to Canada, Northern United States, Europe, and Northern Asia. It is arborescent, growing to the height of 3 to 4.5 M. (10 to 15 feet), and possesses three-lobed serrate leaves and white or yellowish-white flowers. The fruit is a bright-red, elliptic, one-seeded drupe, resembling the cranberry, and on account of which similarity the tree is known as the cranberry tree.

Description.—The bark is found either in flattish or in curved bands or quills, which are occasionally 30 Cm. (12 inches) long, the bark being from 1 to 1.5 Mm. ($\frac{1}{25}$ to $\frac{1}{16}$ inch) in thickness. The outer surface is ash-gray or brownish-gray in color, with scattered somewhat transversely elongated brownish warts, which are due to abrasion, and

more or less marked with blackish dots, and in a longitudinal direction with black irregular lines or thin ridges. Underneath the readily removable corky layer the bark is of a pale brownish or reddish-brown color. On the inner surface the bark is of a dingy white or brownish color. The bark is tough, and on breaking the tissue separates in layers. It is odorless, and has a somewhat astringent and bitter taste.

Constituents.—Chevreul obtained from the berries a volatile acid which he found to be identical with phocenic acid, obtained by him from the fat of the dolphin. Dumas later found phocenic acid to be identical with valerianic acid. Kramer (1834) obtained a volatile acid from the bark, which he found differed from valerianic acid, but L. von Mono (1841) proved their identity. Kramer further found malic acid, an iron-bluing tannin, and a bitter principle, *viburnin*. This in the pure state constituted a nearly white powder, which was neutral, had a purely bitter taste, and was slightly soluble in water, more freely in alcohol, and on incineration left little ash.

VIBURNUM PRUNIFOLIUM, *U. S.*—Black Haw.

The bark of Viburnum prunifolium, *Linné*.

Nat. Ord.—Caprifoliaceæ.

Origin.—The black haw is a tall shrub or small tree from 3–6 M. (10 to 20 feet) high, and grows in thickets throughout the greater portion of the United States east of the Mississippi. Its leaves are opposite, about 5 Cm. (2 inches) long, shining, oval, or obovate, sharply serrulate, and have short slightly margined petioles. The small white pentamerous flowers are in terminal cymes, have a wheel-shaped corolla, and produce small blue-black edible drupes containing a flattish, smooth putamen. The bark is employed in medicine.

Description.—Black-haw bark is in thin quills, and has externally a somewhat glossy purplish-brown, and when older a grayish-brown, color. The surface is marked with scattered small roundish or transversely elongated warts, and often with minute black dots. The thin, papery, corky layer is easily removed from the green outer bark. The inner bark is white and the inner surface smooth. The bark breaks with a short smooth fracture, is without odor, and has a slightly astringent and distinctly bitter taste.

Allied Species.—Viburnum obovatum, *Walter*, grows in the Southern United States, and is a shrub about 2.4 M. (8 feet) high; it is known as *black haw*. The leaves are 12–25 Mm. (½ to 1 inch) long, rather leathery, broadly obovate or spatulate, narrowed into a short petiole, slightly revolute on the margin, either entire or crenate near the apex, and on the lower surface marked with minute brownish dots. The cymes are small and three-rayed, the flowers white, and the fruit black and ovoid-oblong. The leaves are inodorous and have a bitter taste, which is more persistent than that of the brown or reddish-gray bark.

Viburnum lantana, *Linné*, is a European shrub with ovate or oval, slightly heart-shaped, acutely serrate leaves, and with red, finally black, mealy drupes of a mucilaginous and sweet taste. The inner bark is acrid.

Constituents.—Enz (1863) found in the fruit of V. lantana a hygroscopic, neutral, bitter principle readily soluble in water; also valerianic, acetic, tartaric, and tannic acids. H. Van Allen examined black-haw bark, and obtained valerianic acid, viburnin, a resinous body of a very bitter taste containing sugar, tannin (greenish-black with ferric salts), and oxalic, citric, and malic acids. The air-dry bark contained 7 per cent. of moisture and yielded 8.3 per cent. of ash, consisting mostly of earthy carbonates and phosphates.

Action and Uses.—Nothing definite appears to be known respecting the mode of action of either officinal species. Incongruous qualities are assigned to them, such as to be at once nervine, astringent, diuretic, and tonic. According to Payne's experiments, V. prunifolium "paralyzes the centres of voluntary motion and the reflex functions of the spinal cord" (*Med. News*, lx. 371). The only definite medicinal operation attributed to it does not involve any of these operations—viz. a power of preventing *abortion*, particularly when attempted by the use of cotton-root. A case intended to illustrate such virtue in the drug has been published (*Therapeutic Gaz.*, Nov. 1882), but as the patient also took enormous doses of morphine, as well as potassium bromide, it is impossible to believe that the viburnum had any share in the result. Many cases relied on to demonstrate the virtues of the medicine are equally inconclusive, but others appear to sustain the popular estimate of them (Metcalf, *Ther. Gaz.*, Nov. 1882; Wilson, *British Med. Jour.*, Apr. 3, 1886; Campbell, *ibid.*, Feb. 27, 1886; Roberts, *ibid.*, Nov. 26, 1887; Auvard; Schatz, *Therap. Gaz.*, xii. 106, 628; *ibid.*, xiii. 43, 385; Payne, *Med. News*, lx. 371), while still others do not furnish the grounds for a positive judgment. At a meeting of the Materia Medica Society of New York (1883) the value of V. prunifolium was discussed, and no conclusive

evidence of its alleged virtues was adduced. On the same occasion the use of V. opulus was urgently advocated as a very efficient antispasmodic in asthma, hysteria, puerperal and other convulsions, and as "a powerful uterine sedative" (*Med. Record*, xxiii. 188). In 1876, Leonard described this species as "a uterine sedative, and often a remedy for neuralgic *dysmenorrhœa* and for the commonly associated spinal irritation." Indeed, it has been credited with increasing, and also with diminishing, the menstrual flow. Viburnum has been administered in the form of an infusion or a decoction made with Gm. 32 in Gm. 500 (℥j in Oj) of water, and in *doses* of Gm. 32–64 (1 or 2 ounces), repeated every two or three hours. The officinal fluid extract may be prescribed in doses of Gm. 2.00–8 (f℥ss–ij), or the solid extract in gelatin-coated pills of 4 grains, of which from one to three may be given at a dose.

VINA MEDICATA.—Medicated Wines.

Vins médicinaux, Œnolés, Fr.; *Medicinische Weine*, G.

Medicated wines are preparations analogous to tinctures, but differ from them in the menstruum, which contains a much smaller and a somewhat variable quantity of alcohol and a certain proportion of extractive matter and acid potassium tartrate. The menstruum directed for the medicated wines is either dry white wine (*F. Cod., P. G.*), a mixture of white wine and alcohol (*U. S., F. Cod.*), sherry wine (*Br., P. G.*), or red, Lunel, Grenache, Malaga, and other wines (*F. Cod.*). Since even the strongly alcoholic official wines cannot be kept unaltered for an indefinite period if exposed to the air, the medicated wines, which necessarily contain various principles subject to gradual decomposition, should be kept in well-stoppered bottles.

The Pharmacopœia has discontinued the formula for *stronger white wine*, which, according to the U. S. P. 1880, was prepared by mixing 1 part (by weight) of alcohol with 7 parts (by weight) of white wine, and instead now directs a specified quantity of alcohol in each formula where fortification of the wine is desired.

The following medicated wines made with white wine are not mentioned elsewhere:

Vinum condurango, *P. G.;* Wine of condurango, *E.;* Condurangowein, *G.*—Macerate 1 part of finely-cut condurango-bark with 10 parts of sherry wine for eight days, with frequent agitation; express and filter.

Vinum fraxinæ americanæ, *N. F.;* Wine of white ash.—Macerate 8 troyounces of white-ash bark, in No. 40 powder, with 16 fluidounces of stronger white wine for three days, pack in a percolator, and pour on stronger white wine until 16 fluidounces of percolate are obtained.

Vinum picis, *N. F.;* Wine of tar.—Wash 1½ troyounces of tar thoroughly with 4 ounces of cold water by trituration, and pour the water away. Mix the remaining tar with 2 troyounces of moderately fine pumice, and add 16 fluidounces of stronger white wine; stir frequently during four hours, filter through a well-wetted filter, and pass enough stronger white wine through the filter to bring the volume up to 16 fluidounces.

VINUM ALBUM, *U. S.*—White Wine.

Vinum generosum album.— *Vin blanc*, Fr.; *Weisswein*, G.; *Vino blanco*, Sp.

An alcoholic liquid made by fermenting the unmodified juice of the fresh fruit of Vitis vinifera, *Linné* (nat. ord. Vitaceæ), freed from seeds, stems, and skins. When white wine is prescribed without further specification, it is recommended that dry white wine of domestic production (such as California Riesling, Ohio Catawba, etc.) be employed. White wine should be preserved in well-closed, full casks or in well-stoppered bottles in a cool place.—*U. S.*

Nat. Ord.—Vitaceæ.

Origin.—American wines are mostly obtained from the fruit of cultivated varieties of Vitis Labrusca, *Linné*, and more particularly from Catawba, Concord, and Isabella grapes. The Clinton grape is a variety of V. æstivalis, *Michaux;* the Delaware grape is derived from V. cordifolia or V. riparia, *Michaux;* and the Scuppernong grape from V. vulpini, *Linné*. The European grape was introduced into California at an early period, and large quantities of wine are now manufactured from the different varieties. All European wines are prepared from the fruit of Vitis vinifera, *Linné* (see Uvæ), which is a native of Western Asia and has been cultivated for many centuries; it is not unlikely

that this species originated from two or three different plants, supposed by some botanists to be indigenous to India, and by others to be still found in the wild state in Eastern countries and in Southern and Central Europe.

Manufacture of Wine.—In addition to the constituents of grapes enumerated under UVÆ, vegetable albumen, glutinous matter, pectin, and various extractive matters are found in the juice of grapes, and occasionally racemic acid, either in the free state or partly combined with bases. Besides tartrates, the saline constituents are potassium sulphate, sodium chloride, calcium phosphate, magnesia, alumina, and silica. The relative amount of these principles varies considerably, depending on the nature of the soil and on atmospheric conditions during the growth and ripening of the fruit, when the free acid is gradually diminished and the sugar considerably augmented in quantity. The sugar varies in amount between 12 and 30 per cent., the larger quantity being produced in warm climates. It is obvious from this that the treatment of the grape-juice for the production of wine must vary under different circumstances and in different countries. The grapes are crushed and the juice fermented in the presence of the husks, or the juice, called *must*, is fermented by itself, in which case a light-colored wine is obtained. Red wines are made by fermenting with husks and seeds, called the *marc*, of red or purple grapes. In a short time after the must has been pressed, fermentation commences, and continues for two or three weeks, when the liquid becomes somewhat clear, and is removed from the precipitate into another vessel, where a slow fermentation, called the *after-fermentation*, proceeds for several weeks or months, requiring the occasional removal of the liquid from the sediment formed, until it is fit to be transferred into casks, where it is allowed to "ripen." The best wines are usually bottled some time after they have become perfectly clear, the complete clarification being effected by gelatin, which, in combining with the tannin present, forms an insoluble compound, carrying down with it all traces of yeast and other matters held in suspension. The "bouquet" of wine is much improved after bottling, and red wines, which do not contain a large amount of tannin, become darker, while wines rich in tannin form a deposit in the bottle and become lighter in color.

The conditions under which fermentation takes place, and the results, are explained on page 147. In the presence of the numerous constituents of grapes odorous principles are generated during fermentation, to which wines owe their peculiar aroma or bouquet. If the must contains a moderate quantity of sugar, this is entirely or nearly decomposed into alcohol and carbon dioxide, resulting in a *dry wine*. But in a strongly saccharine must fermentation ceases before the sugar is completely consumed, and the product is a *sweet wine* (vin de liqueur, *Fr.*). In some cases the amount of sugar in the juice is increased by exposing the cut ripe grapes for some time to the sun until a portion of the water has evaporated, or by concentrating a portion of the juice before fermentation. As the alcohol increases during the fermentation of the must, the acid potassium tartrate becomes less soluble and is gradually deposited, the deposition continuing for some time after the storing of the wine in casks.

If wine is bottled before it has undergone the after-fermentation, a *sparkling wine* will be obtained. The fermentation will slowly proceed in the bottle, which is placed upside down, so that the precipitate which forms may settle in the neck, and may be finally withdrawn by carefully removing the stopper and quickly replacing it. The effervescence of sparkling wines is produced by the carbon dioxide confined in the bottle.

IMPROVING.—This term is used to include all those manipulations designed to preserve wine or render it more pleasing in appearance and taste by the addition of alcohol, glycerin, coloring matter, sugar, and other substances. In many cases so-called "improving" must be considered to be merely adulteration; but from the natural variation of the composition of grape-juice it is sometimes desirable to correct an excess or deficiency of one or more constituents, and for this purpose the following processes have been suggested:

1. Gypsum is largely employed in some parts of Europe as an addition to the must, for the purpose of hastening the clarification of wine, which then contains potassium sulphate in the place of bitartrate.

2. Chaptal (1800) proposed the removal of excessive acidity by marble and the addition of sugar to the must.

3. Gall proposed to correct excessive acidity by the addition to the must of sugar and water, whereby, evidently, an acid grape-juice is made to yield a correspondingly larger amount of wine.

4. Petiot (1859) suggested the utilization of the marc left on expressing the must, by

fermenting with it a solution of sugar, the product being either sold as wine or mixed with other wines.

5. Liebig (1848) suggested the removal of free acid by the addition of a concentrated solution of potassium tartrate in such proportion as to form bitartrate, which will be deposited from the wine.

6. To render weak wines stronger without foreign additions, Melsens (1873) introduced the freezing process, whereby a portion of the water is removed in the form of ice.

7. Pasteur's method consists in the heating of wine to from 50° to 65° C. (122°–149° F.), air being excluded, for the purpose of destroying fungoid germs and rendering the wine more permanent.

Properties.—As a class, white wines are distinguished from red wines by the absence of red coloring matter and of notable quantities of tannin, though minute proportions of this compound are usually present. They are never colorless, but vary in shade between pale-yellow and deep-amber color.

Sherry wine (Vinum Xericum, *Br.;* V. Xerense, *P. G.* 1872) has a rather deep-amber color, an agreeable vinous odor, and a warm and very slightly acid taste. We found (1886) its specific gravity to range between 0.978 and 0.995, and its average alcoholic strength to be 20.34 volumetric per cent.; the sugar and extractive averaged 3.27 (highest 5.3) per cent. in 67 samples examined. Similar wines are produced in various parts of Spain, Portugal, the Canaries, and Madeira, several of which are met with in our commerce. *Lisbon wine* has a density of about 0.990, and contains 19 or 20 per cent. of alcohol. *Teneriffe wine* closely resembles the preceding in properties. A stronger wine is *Madeira wine*, which usually contains between 19 and 22 per cent. of alcohol; it has a different somewhat nutty flavor.

Wines of similar strength in alcohol are also made in Italy (*Marsala*), Greece (*vino santo*), and the Cape Colony (*Constantia*). Southern France produces wines containing 14 to 16 per cent. of alcohol, of which those of *Lunel* and *Grenache* are ordered by the Codex. *Burgundy* wines are of about the same strength. Very sweet wines, rich in alcohol, are, among others, *Tokay* (Hungary), *Lachrymæ Christi* (Italy), and *Malaga* (Spain).

The white *Rhenish wines* are known here as *hock* (from *Hochheimer*). They have a more acidulous taste than the preceding wines, from the presence of acid potassium tartrate and the nearly total absence of sugar. They are of a pale-yellow color, and usually contain between 8 and 10 per cent. of alcohol. *Moselle wine* is nearly of the same strength. The *French wines*, both white and red, are required to contain about 10 per cent. of alcohol (*F. Cod.*).

The white wines of the Mississippi and Ohio Valleys and the *California wines* resemble the wines of Central and Southern Europe in appearance, flavor, and alcoholic strength; the weaker varieties of the latter, which are known as *California hock*, have not the fine bouquet of the better qualities of Rhenish wines, but the quality of American wines has considerably improved of late years.

The sparkling *champagne wines* contain between 10 and 12 per cent. of alcohol.

Constituents.—The principal constituents of all wines are water and alcohol. The amount of the latter present in different wines has been given above. The acidulous taste of wine is due to *acid potassium tartrate*, and small quantities of *acetic acid* are met with in old wines, resulting from the spontaneous oxidation of alcohol. A somewhat larger proportion of acetic acid is usually present in the wine of the Eastern section of the United States. The amount of *sugar* varies considerably: while the weaker dry wines contain none or but very little, it is found in sherry to the extent of from 1 to 5 per cent., increases in champagne sometimes to 5 or 6 per cent., in port wine to 6 or 7 per cent., and in the sweet wines, like *Malmsey Madeira*, to 11 or 15 per cent. or more. The "body" of wine has been ascribed by Fauré to a principle which he named *œnanthin*, and which is probably of the nature of gum or dextrin. *Tannin* seems to be present in all wines—in minute proportion in the white, and in larger proportion in the red wines. The *coloring matter* of wine varies for causes stated above; the color of red grapes is not soluble in water, but is extracted during fermentation as the alcohol increases. The *aroma* of wine is doubtless due to the presence of various compound ethers formed in the juice while fermenting. These exist in very minute quantities, and have for this reason not been accurately examined; but the following have been stated to contribute to the aromatic odor of wine: acetic, butyric, caprylic, caproic, œnanthic, pelargonic, capric, and propionic ethers, besides aldehyde, acetal, and probably other compounds.

The inorganic constituents of wine are the same as those of grape-juice, except that calcium tartrate and the greater portion of acid potassium tartrate have been deposited; the ash varies between about .1 and .5 per cent.

The U. S. Pharmacopœia not only permits, but evidently encourages, the use of native wines, provided they be pure and contain between 10 and 14 per cent. by weight of absolute alcohol. From causes explained before, the composition of wines made from the same variety of grape grown in different localities, or from different vintages in the same locality, must be expected to vary to some extent; every quantitative analysis of wine, therefore, refers only to the sample examined. A large number of American wines have been analyzed by Prof. H. B. Parsons, which, classified in principal groups, show the following results for 100 parts of white wines:

	51 Dry Wines.			7 Sherry Wines.			22 Sweet Catawba, Angelica, etc.			15 Sparkling Wines.		
	Average.	Highest.	Lowest.	Average.	Highest.	Lowest.	Average.	Highest.	Lowest.	Average.	Highest.	Lowest.
Specific gravity . .	.9926	1.0105	.9845	.9974	1.0074	.9873	1.0318	1.0515	.9948	1.0255	1.0402	1.0174

Fixed acid, as tartaric	.313	.561	.121	.277	.418	.209	.313	.465	.234	.425	.626	.322
Volatile acid, as acetic	.294	.508	.068	.263	.380	.164	.208	.463	.046	.252	.472	.119

One sweet wine (Muscatel) contained 25.37 per cent. of glucose and 31.34 per cent. of total residue.

Changes.—Like other weak alcoholic liquids, wine is apt to undergo acetic fermentation, which is prevented by excluding atmospheric oxygen. Mucous fermentation causes wine to become ropy; white wines are subject to this change more than red wines, caused by the presence of insufficient tannin in the must for precipitating all the albuminoids. Some wines, like Burgundy, are liable to acquire a bitter taste, and occasionally wine becomes mouldy. Scrupulous cleanliness of the vessels in which wine is kept and exclusion of air will prevent most of these changes.

Tests.—With the exception of the U. S. P., none of the pharmacopœias give any tests for determining the quality of wine, which is directed to be ascertained as follows: "White wine should have a full, fruity, agreeable (and red wine a moderately astringent) taste, without excessive sweetness or acidity, and it should have a pleasant odor, free from yeastiness. Its sp. gr. at 15.6° C. (60° F.) should not be less than 0.990 (red wine 0.989) nor more than 1.010. If 10 Cc. of white wine be diluted with an equal volume of distilled water and treated with 5 drops of test-solution of ferric chloride, only a faint, greenish-brown color should make its appearance (absence of more than traces of tannic acid) (with red wine the liquid should acquire a brownish-green color, due to tannic acid). Upon evaporation and twelve hours' drying on the water-bath it should leave a residue of not less than 1.5 per cent. nor more than 3.0 per cent. (red wine between 1.6 and 3.5 per cent.). Using phenolphtalein test-solution as an indicator, 50 Cc. of white wine should require for complete neutralization not less than 3 nor more than 5.2 Cc. of the normal volumetric solution of potassium hydroxide (limit of free acid). Tested by the following method, white (and red) wine should contain not less than 10 per cent. nor more than 14 per cent., by weight (equivalent to 12.4 to 17.3 per cent. by volume), of absolute alcohol: Take the specific gravity (to four decimals) of a sufficient portion of the white wine at the temperature of 15.6° C. (60° F.), evaporate the wine in a tared capsule to one-third of its original weight, cool, and add water until the liquid measures its original volume at 15.6° C. (60° F.); then take the specific gravity (to four decimals) again. The difference between the two specific gravities, deducted from 1.0000, corresponds to the specific gravity of an alcohol containing the same percentage of absolute alcohol, by weight or volume, as the wine under examina-

tion, the corresponding percentage being ascertained by referring to the alcoholometric tables.—*U. S.*

Aside from the coloring matter, the requirements and tests of the Pharmacopœia are alike for white and red wine, with slight modifications for the latter, as indicated above. Wines from fruit other than the grape, and artificial or sophisticated wines, may correspond closely with the above requirements. For the detection of such the following brief summary from the observations of Prof. Nessler will be useful: By far the largest number of dry grape-wines contain between 1.6 and 2.2 per cent. of *solid matter;* this is conveniently estimated by evaporating the alcohol and diluting the residue with water to the original volume, when the liquid should have the specific gravity 1.007 or 1.008, and should not be less than 1.005. Grape-wines contain no *citric acid* and little or no free *tartaric acid.* The latter is best detected by agitating the wine with powdered potassium bitartrate until saturated, and adding to the filtrate potassium acetate, when in the presence of free tartaric acid a precipitate will be produced. Most pure wines yield a precipitate with tartaric acid, proving the presence of potassium salts other than bitartrate. To detect citric acid add to the wine an excess of lime, filter, acidulate with acetic acid, add excess of barium chloride, filter from the barium sulphate, and add excess of ammonia, when barium citrate will be precipitated. For the detection of free sulphuric acid strips of filtering-paper about 30 Cm. (12 inches) long are suspended in such a manner that the lower end dips into the wine, which is gradually absorbed and evaporates from the upper part, where the extractive matters and sulphuric acid become more concentrated; after twenty-four hours the paper is carefully dried, and then heated to 100° C. (212° F.), when the portion charged with extractive becomes brown or black and frequently brittle from the free sulphuric acid, the reaction being more delicate in the presence of 0.1 or 0.2 per cent. of sugar. The brown-yellow *coloring matter* of wine containing a little tannin is precipitated on agitation with egg albumen, while the color produced by caramel is not altered.

Winckler stated that cider and other fruit-wines contain lactic acid and calcium lactate, which are not found in grape-wine. Tuchschmid (1870) found the amount of calcium carbonate obtainable in the ashes of grape-wine never to exceed 0.049 per cent., while other fruit-wines yield between 0.11 and 0.40 per cent. of the same salt. The amount of sulphates in wine varies in most cases, so as to represent between .01 and .03 per cent. of sulphuric acid; Nessler found occasionally .11 per cent. Wines treated with gypsum contain a larger quantity.

The determination of alcohol is usually effected by one of the two following methods: A definite quantity of wine is distilled by means of a water-bath until one-half of the liquid has passed over; the distillate is diluted with distilled water to the original volume or weight of the wine, when its specific gravity indicates the alcoholic strength; or, the residue in the still is diluted with water to the original volume or weight of the wine; its specific gravity is now ascertained, and from this figure is deducted the specific gravity of the wine; the difference, representing the solid constituents, is deducted from 1.000 (density of water), and the figure thus obtained gives the density of the alcohol present. The method adopted by the Pharmacopœia is a modification of the last one described, and was suggested by Prof. Parsons. A number of instruments have been constructed by means of which the alcoholic strength may be determined either from the pressure or the heat of the vapors of the boiling liquid; volatile acids, if present, must be previously neutralized.

Action and Uses.—Wine, including all forms of genuine wine, is essentially a stimulant of the nervous and circulatory systems, but its mode of stimulation is unlike that of mere alcohol. In due proportion it gives to all the faculties increased activity and freedom of action, quickening and brightening the intellect and the imagination, warming the feelings, invigorating the digestive powers, and diffusing a cordial satisfaction throughout the whole being. Distilled spirits, on the other hand, tend to benumb the faculties even while stimulating them, so that they seem to be struggling under a brute force; the exhilaration they produce is usually fierce or maudlin, and they leave behind them a dull and inert dejection. (See ALCOHOL.) As already stated, the peculiar effects of wine are due to the salts, acids, sugar, and, above all, the ethereal elements, in which it abounds, and which, while they tend to mitigate the anæsthesia produced by the alcohol of the liquid, ensure a more rapid discharge of this substance from the system. The white wines, as a class, are distinguished by the rapidity with which they exhilarate and intoxicate, as well as by the relatively transient character of the excitement they produce, and by their marked diuretic action. Most of

the red wines, and especially port wine, contain a portion of tannin, which retards their absorption, and therefore lessens their immediate stimulant effects. They are, on the other hand, more or less tonic, and hence become well adapted to the convalescent stages of acute disease and to states of chronic debility. (See VINUM RUBRUM.) The effects of wine in excessive doses resemble more nearly those produced by distilled spirits, yet even then they are less extreme and debasing. Its habitual use is conducive to the health of those who drink it in moderation, and is the best corrective of the brutality and preventive of the crime which everywhere attend the consumption of ardent spirits. The very quantity of it required to produce intoxication tends to limit the mischiefs of its inordinate use; and even when "the sweet poison of the misused wine" is indulged in beyond measure, its mischievous influence upon the health is less than that of alcohol, for, while the latter tends directly to occasion fatal disease of the liver, heart, and kidneys, the intemperate use of wine is more apt to engender gout, gravel, and nervous affections. Even these results are rarely attributable to some of the wines which are most largely used, as the Rhenish, Austrian, Hungarian, Bordeaux, and most Italian wines, both white and red.

Wine is employed in the treatment of the same form of diseases for which distilled alcohol is appropriate, but, according to general usage, in the less grave forms, and for women, children, and old persons rather than for adult men. The clearest indication for its use is furnished by *adynamic fevers*, and most of all *typhus fever*, a disease in which enormous quantities of wine have sometimes been administered with the most salutary results. In a less degree it is useful in *typhoid fever* and in all febrile affections which assume the *typhoid state*, provided that symptoms of the following character are present: viz. prostration, wandering, delirium, petechiæ, stupor, and brown tongue; feebleness, irregularity, dicrotism or softness of the pulse; and particularly feebleness or absence of the first sound of the heart. When delirium, unconsciousness, and dryness of the tongue have been succeeded by a state of exhaustion, languor, and debility, with imperfect sleep and anorexia, the cordial operation of wine is a precious help toward the cure. And under these circumstances sparkling wines are often more acceptable to the stomach than others. But it is as true of wine as of distilled spirits, that the necessity for it is often more apparent than real, and that a premature and excessive use of it renders the patient insensible to its operation when it has become essential to his recovery. We have never had such good reason to be pleased with the results of treatment in typhoid fever as when in a large hospital service the use of alcohol in this disease was almost wholly omitted.

During *convalescence* from many diseases wine taken with food is often a potent aid to recovery, and it is often also of essential utility in chronic affections which waste the strength by profuse *discharges* or by *pain* or by inducing an *anæmic* condition. In all of these cases red wines are more efficacious than white. The latter, however, and in general the more stimulating wines, are best adapted to cases in which a speedy but transient influence is intended, as where *syncope* is imminent or the patient is reviving from it after powerful nervous shocks, exhausting fatigue of body or mind, severe pain, hæmorrhage, etc., and in cases of debility of the heart arising from structural alterations in it. In the milder forms of *delirium tremens*, especially as they occur in females, and notably in those of the better classes, wine is greatly to be preferred to distilled spirits. In some minor *spasmodic affections*, as the *vomiting* of pregnancy or of sea-sickness, the sparkling wines are often of great service. Infantile reflex *convulsions* may frequently be prevented or mitigated by a timely dose of wine administered by the rectum or the mouth. It is equally efficient in all other affections in which danger arises from debility and its immediate consequences, and among them *capillary bronchitis* may be particularly noted. *Tetanus* has been successfully treated by wine, and the depressing action of *tobacco* and other sedatives of the heart and nervous system may be counteracted by its means.

It seems superfluous to say a word of the special virtues of sherry wine, since it is almost impossible to procure any of it which is pure and presents that peculiar "nutty" flavor, and that "dryness," or slight acidity, which at one time were characteristic of it, and which rendered it a valuable cordial in exhaustion of the nervous system and of the heart and a wholesome aid to feeble digestion. In England, where, more than elsewhere, it was generally used by the richer classes, it was regarded as especially appropriate for dyspeptic, gouty, and rheumatic invalids. At present those who prescribe "sherry wine" should know that there is seldom any wine in the liquid at all, but that it consists usually of alcohol, water, and flavoring ingredients. It is far better to use medicinally whiskey

made from wheat or rye, which there is less temptation for the dishonest dealer to adulterate, than the mischievous compounds sold under the name of sherry. Sherry is less astringent, and, according to some analyses, slightly less, and according to others slightly more, alcoholic than port. Commercial sherry wine is less suited than pure wine for making *wine whey*, which is prepared by adding the wine to milk at the boiling temperature, in the proportion of from 2 to 8 fluidounces of the former to a pint of the latter, straining off the whey and sweetening it. It is a mild and slightly nutritious stimulant much used in cases of debility from exhaustion and in the *typhoid state*. Wine diluted with water may be given by enema with scarcely less advantage than by the stomach. (For a fuller description and history of wines the reader is referred to STILLÉ, *Therapeutics*, 4th ed., ii. 710.)

VINUM ALOES, *Br.*—WINE OF ALOES.

Vinum aloeticum.—*Vin (Œnolé) aloétique*, Fr.; *Aloewein*, G.

Preparation.—Socotrine aloes 1½ oz. av.; cardamom-seeds, freed from the pericarps and bruised, ginger, in coarse powder, each 80 grains; sherry, sufficient to make 2 pints. —*Br.* Purified Aloes 6 parts; Cardamom 1 part; Ginger 1 part; Stronger White Wine a sufficient quantity; to make 100 parts. Mix the aloes, cardamom, and ginger, and reduce them to a moderately coarse (No. 40) powder. Macerate the powder with 90 parts of stronger white wine for seven days, with occasional agitation, and filter through paper, adding, through the filter, enough stronger white wine to make the filtered liquid weigh 100 parts.—*U. S.* 1880.

Uses.—This preparation is no longer recognized in the U. S. Pharmacopœia, and is rarely used, because, like all liquid preparations of aloes, its taste is repulsive, and the pilular forms of the medicine are therefore more acceptable. Yet it probably has the advantage over them of being already a solution, and therefore of acting in a relatively smaller dose than aloes itself. It is useful in cases of habitual *constipation* from torpor of the colon and rectum, especially when associated with flatulent dyspepsia, gout, or amenorrhœa. *Dose*, as a laxative, about Gm. 16 (ʒiv).

VINUM ANTIMONII, *U. S.*—WINE OF ANTIMONY.

Vinum antimoniale, Br.; *Vinum stibiatum, s. emeticum*, P. G.—*Antimonial wine*, E.; *Vin émétique, Vin antimonié, Vin stibié*, Fr.; *Brechwein*, G.

Preparation.—Antimony and Potassium Tartrate 4 Gm.; Boiling Distilled Water 65 Cc.; Alcohol 150 Cc.; White Wine a sufficient quantity; to make 1000 Cc. Mix the alcohol with 850 Cc. of white wine. Dissolve the antimony and potassium tartrate in the boiling distilled water, and add the solution to the mixture. When the liquid is cold filter it through paper, and add enough white wine, through the filter, to make the product measure 1000 Cc.—*U. S.*

To make 1 pint of wine of antimony use 29¼ grains of antimony and potassium tartrate, 1 fluidounce of boiling distilled water, 2½ fluidounces of alcohol, and sufficient white wine to make 16 fluidounces of solution.

Each Cc. of finished product contains 0.004 Gm. (or 1 fluidrachm, about ¼ grain) of tartar emetic.

Nearly the same proportions are the following: Tartarated antimony 40 grains; sherry 1 pint (Imperial).—*Br.* Tartar emetic 1 part; sherry 250 parts.—*P. G.*

If made with good wine and judiciously preserved, antimonial wine will keep unaltered for a long time.

Uses.—The chief value of antimonial wine consists in its being a convenient addition to febrifuge solutions, and especially in association with a liquid preparation of opium and spirit of nitrous ether. In such combinations it greatly promotes the diaphoresis which is a natural crisis of *fever*. The direct sedatives of the heart have no such salutary operation. In a like manner it may be added to mixtures for promoting expectoration in febrile affections of the air-passages, as in the officinal compound liquorice mixture. It should seldom be used as an emetic, for its action in children is too depressing, and for adults the necessary dose of it is such that the stimulant action of the wine counteracts the sedative or nauseant operation of the antimonial. As a febrifuge and expectorant the *dose* of antimonial wine is about Gm. 0.60 (gtt. x), repeated at longer or shorter intervals according to its effects. This dose is preferable to the larger ones generally recommended.

VINUM AROMATICUM, *U. S. 1880, F. Cod.*—Aromatic Wine.

Vin (Œnolé) aromatique, Fr.; *Kräuterwein*, G.

Preparation.—Lavender 1 part; Origanum 1 part; Peppermint 1 part; Rosemary 1 part; Sage 1 part; Wormwood 1 part; Stronger White Wine a sufficient quantity; to make 100 parts. Mix the solid ingredients, and reduce them to a coarse (No. 20) powder. Moisten the powder with 4 parts of stronger white wine, pack it moderately in a conical glass percolator, and gradually pour enough stronger white wine upon it to make the filtered liquid weigh 100 parts.—*U. S.* 1880.

This is equivalent to the preparation, somewhat simplified, of the old French Codex. The present Codex orders vulnerary tincture 1 part, red wine 7 parts.

Tinctura vulneraria, Alcoolature (Teinture) vulnéraire, *F. Cod.*, is made by macerating 100 Gm. each of the fresh leaves and tops of eighteen plants, including the six of the above formula, and 3000 Gm. of alcohol sp. gr. 0.863.

Uses.—Aromatic wine (omitted from Pharm. 1890) is designed for topical purposes only. It represents a class of preparations which were formerly in common use as vulneraries, either as applications to recent *wounds* or to stimulate indolent *ulcers*. An almost identical preparation was used by Ricord as a dressing for *chancres*, and is now officinal in France. It is applied on charpie. The old aromatic wine of the French Codex contained, besides the herbs above enumerated, angelica, fennel, hyssop, rosemary, rue, thyme, etc., and was infused in red wine.

VINUM AURANTII, *Br.*—Orange Wine.

Wine made in Britain by the fermentation of a saccharine solution to which the fresh peel of the bitter orange has been added.—*Br.*

It is a vinous liquid, having a gold-cherry color and a taste and aroma derived from the bitter orange-peel. It contains about 12 per cent. of alcohol, and is but slightly acid to test-paper.

Uses.—Orange wine is used exclusively as a flavoring ingredient of mixtures and as an excipient in certain British officinal preparations.

VINUM COLCHICI RADICIS, *U. S.*—Wine of Colchicum-root.

Vinum colchici, Br.; *Vinum de colchico*, F. Cod.—*Vin (Œnolé) de bulbe de colchique*, Fr.; *Zeitlosenknollenwein*, G.

Preparation.—Colchicum-root, in No. 30 powder, 400 Gm.; Alcohol 150 Cc.; White Wine a sufficient quantity; to make 1000 Cc. Mix the alcohol with 850 Cc. of white wine. Moisten the powder with 100 Cc. of the menstruum, pack it moderately in a conical glass percolator, and gradually pour upon it, first, the remainder of the menstruum, and afterward enough white wine to make the product measure 1000 Cc.—*U. S.*

To make 1 pint of wine of colchicum-root use 6 av. ozs. and 300 grains of powdered colchicum-root, and moisten with 3¾ fluidounces of the menstruum (alcohol 15 volumes, white wine 85 volumes).

Colchicum, sliced, dried, and bruised, 4 oz. av.; sherry sufficient to make 1 pint (Imperial).—*Br.* Fresh colchicum-root 100 Gm., strong wine (vin de Grenache) 1000 Gm.—*F. Cod.*

This preparation is recognized in Great Britain as *wine of colchicum*, under which name in the United States the wine of colchicum-seeds is usually understood. Owing to the deterioration of colchicum-tuber when long kept, the preparation is apt to be deficient in strength, since the drug cannot be at all times obtained fresh or recently dried.

Uses.—This preparation, which is believed to possess all the virtues of colchicum, may be prescribed in *doses* of Gm. 0.60 (♏ x), and gradually increased.

VINUM COLCHICI SEMINIS, *U. S.*—Wine of Colchicum-seed.

Vinum colchici, P. G.—*Vin (Œnolé) de semence de colchique*, Fr.; *Zeitlosensamenwein*, G.

Preparation.—Colchicum-seed, in No. 30 powder, 150 Gm.; Alcohol 150 Cc.; White Wine a sufficient quantity; to make 1000 Cc. Mix the alcohol with 850 Cc. of white wine. Macerate the powder with 900 Cc. of the mixture during seven days in a closed vessel, with occasional agitation. Then filter through paper, adding, through the filter, first, the remainder of the menstruum, and afterward enough white wine to make the product measure 1000 Cc.—*U. S.*

To make 1 pint of wine of colchicum-seed use 2½ av. ozs. of powdered colchicum-seed, and macerate for seven days with 14½ fluidounces of the menstruum (alcohol 15 volumes, white wine 85 volumes); after filtration pass sufficient menstruum through the filter to make 16 fluidounces.

Bruised colchicum-seed 60 Gm., strong wine 1000 Gm.—*F. Cod.* Coarsely powdered colchicum-seed 1 part, sherry wine 10 parts.—*P. G.*

In order to extract the colchicine the seeds require to be well bruised. By passing them several times through a good drug-mill, regulating at the same time the grinding surface, they may be obtained of a sufficiently fine powder. If a suitable mill is not at hand, they should be macerated in a portion of the wine for several days, and be bruised in a mortar while damp. None of the pharmacopœias permit digestion of the unbroken seeds. 10 parts *U. S.* are equal to 15 parts *P. G.* and 25 parts *F. Cod.* of this wine.

Uses.—The commencing *dose* is about Gm. 2 (fʒss).

VINUM ERGOTÆ, *U. S.*—Wine of Ergot.

Vin de seigle ergoté, Fr.; *Mutterkornwein*, G.

Preparation.—Ergot, recently ground, in No. 30 powder, 150 Gm.; Alcohol 150 Cc.; White Wine a sufficient quantity; to make 1000 Cc. Mix the alcohol with 850 Cc. of white wine. Moisten the powder with 40 Cc. of the mixture, pack it moderately in a conical glass percolator, and gradually pour upon it, first, the remainder of the menstruum, and afterward enough white wine to make the product measure 1000 Cc.—*U. S.*

To make 1 pint of wine of ergot use 2½ av. ozs. of powdered ergot, and moisten with ¾ fluidounce of the menstruum (alcohol 15 volumes and white wine 85 volumes).

Uses.—The wine is less frequently employed than other preparations of ergot, but may be prescribed in *doses* of Gm. 4–12 (fʒj–iij).

VINUM FERRI, *Br.*—Wine of Iron.

Vinum chalybeatum, s. martiatum.—Vin chalybé, Fr.; *Eisenwein, Stahlwein*, G.

Preparation.—Take of Fine Iron Wire (about No. 35) 1 ounce; Sherry 1 pint. Macerate for thirty days in a closed vessel, the iron being almost, but not quite, wholly immersed in the wine, the vessel frequently shaken, and the stopper removed; then filter.—*Br.*

The acid potassium tartrate dissolves the iron, with the evolution of hydrogen, resulting in the formation of ferrous tartrate or of its double salt with potassium tartrate. Owing to the variable acidity of different wines, and to the necessarily variable composition of this preparation, it has very properly been discarded by most pharmacopœias, or has been replaced by one of more definite strength in iron, like the wine of citrate of iron.

Uses.—This preparation is one of the mildest of ferruginous medicines. It is, however, quite as well prepared extemporaneously by making a solution of iron and potassium tartrate in sherry or Rhenish wine, in the proportion of 10 grains to the fluidounce. The *dose* of the officinal wine is Gm. 4–16 (fʒj–iv), and of the magistral solution nearly twice as much.

VINUM FERRI AMARUM, *U. S.*—Bitter Wine of Iron.

Vinum de cinchona martiatum, F. Cod.; *Vinum chinæ ferratum.—Vin (Œnolé) de quinquina ferrugineux*, Fr.; *Chinaeisenwein*, G.

Preparation.—Soluble Iron and Quinine Citrate 50 Gm.; Tincture of Fresh Orange-peel, 150 Cc.; Syrup 300 Cc.; White Wine a sufficient quantity; to make 1000 Cc. Dissolve the soluble iron and quinine citrate in 500 Cc. of white wine. Add to this the tincture of fresh orange-peel and the syrup, and, lastly, enough white wine to make the product measure 1000 Cc. Set the mixture aside for several days, then filter, and pass enough white wine through the filter to restore the original volume.—*U. S.*

To make 1 pint of bitter wine of iron dissolve 365 grains of soluble iron and quinine citrate in 8 fluidounces of white wine; add 2½ fluidounces of tincture of fresh orange-peel, 5 fluidounces of syrup, and sufficient white wine to make 16 fluidounces of solution.

Each Cc. of the finished product contains 0.05 Gm. (or 1 fluidrachm nearly 3 grains) of the soluble scale salt of iron and quinine.

This an adaptation of the formula adopted by the American Pharmaceutical Association in 1875, and resembles that of the old French Codex, but contains more iron. The new French Codex directs 2 Gm. each of ferrous sulphate and citric acid to be dissolved in 10 Gm. of boiling water, and this solution added to 990 Gm. of wine of pale cinchona.

Uses.—This solution contains in each fluidrachm nearly 3 grains of the soluble citrate of iron and quinine. It is a mild preparation, but is very efficient in cases of moderate *anæmia* and *debility*. The ordinary *dose* is Gm. 4–8 (f℥j–ij).

VINUM FERRI CITRATIS, *U. S., Br.*—Wine of Ferric Citrate.

Vinum chalybeatum, F. Cod.—*Vin chalybé*, *Vin (Œnolé) ferrugineux*, Fr.; *Eisenwein*, G.

Preparation.—Iron and Ammonium Citrate 40 Gm.; Tincture of Fresh Orange-peel 150 Cc.; Syrup 100 Cc.; White Wine a sufficient quantity; to make 1000 Cc. Dissolve the iron and ammonium citrate in 700 Cc. of white wine. Add to this the tincture of fresh orange-peel and the syrup, and, lastly, enough white wine to make the product measure 1000 Cc. Set the mixture aside for several days, then filter, and pass enough white wine through the filter to restore the original volume.—*U. S.*

To make 1 pint of wine of ferric citrate dissolve 292 grains of iron and ammonium citrate in 11 fluidounces of white wine; add 2½ fluidounces of tincture of fresh orange-peel, 1¾ fluidounces of syrup, and sufficient white wine to make 16 fluidounces of solution.

Each Cc. of the finished product contains 0.04 Gm. (or 1 fluidrachm about 2¼ grains) of iron and ammonium citrate.

Dissolve citrate of iron and ammonia 160 grains in orange wine 1 pint (Imperial), and after three days filter.—*Br.*

Citrate of iron and ammonia 5 Gm., strong wine (vin de Grenache) 1000 Gm.—*F. Cod.*

Uses.—The wine of citrate of iron has nearly the same qualities as wine of iron, and, like it, may be used when the stomach is irritable. The *dose* is Gm. 4–16 (f℥j–iv).

VINUM IPECACUANHÆ, *U. S., Br., P. G.*—Wine of Ipecac.

Vin d'ipécacuanha, Fr.; *Brechwurzelwein*, G.

Preparation.—Fluid Extract of Ipecac 100 Cc.; Alcohol 100 Cc.; White Wine 800 Cc.; to make 1000 Cc. Mix them. Set the mixture aside for a few days, then filter.—*U. S.*

To make 1 pint of wine of ipecac mix 1 fluidounce and 288 minims, each, of fluid extract of ipecac and of alcohol, with sufficient white wine to make 16 fluidounces. Each Cc. represents 0.1 Gm. (or 1 fluidrachm very nearly 6 grains) of ipecac.

Macerate for a day ipecacuanha 1 oz. in acetic acid 1 fl. oz.; obtain with water 20 oz. of percolate; evaporate to dryness over a water-bath; powder; macerate in sherry wine 1 pint (Imp.) for two days, and filter.—*Br.* Ipecac 1 part, sherry wine 10 parts.—*P. G.*

Uses.—Wine of ipecacuanha contains all the virtues of the drug. It is a very inappropriate form for the production of emesis, since the large proportion of alcohol contained in it counteracts the emetic operation of the ipecacuanha, and may be unsuited to the febrile elements of the affection for which it is prescribed. This objection applies less forcibly to its use as a diaphoretic and expectorant. It is especially useful, when associated with spirit of nitrous ether, in favoring diaphoresis in *catarrhal fever*, *muscular rheumatism*, etc. In infantile and also in senile *bronchitis* it is very serviceable when the bronchial secretions obstruct the air-passages, and when an emetic as well as a stimulant operation is called for. It may be applied directly to the air-passages by means of the hand- or steam-atomizer, and in this manner is very efficient in *chronic bronchitis*. In the *vomiting* of pregnancy this preparation, in hourly doses of 1 drop, sometimes arrests that distressing symptom. It is probable that in doses nearly as small it would be found as useful as powdered ipecacuanha has proved in relieving atonic *dyspepsia* and *chronic diarrhœa* caused by intestinal debility.

The *dose* of wine of ipecacuanha as an emetic is stated to be Gm. 32 (f℥j) for an adult, and Gm. 4 (f℥j) for an infant, but, for the reasons assigned, it is not eligible for this purpose. As an expectorant or diaphoretic the proper dose is Gm. 0.30–0.60 (gtt. v–x), repeated every half hour or hour.

VINUM OPII, *U. S., Br.*—Wine of Opium.

Vinum opii compositum, F. Cod.; *Tinctura opii crocata*, P. G.; *Laudanum liquidum Sydenhami.—Sydenham's laudanum*, E.; *Laudanum de Sydenham, Vin d'opium composé*, Fr.; *Safranhaltige Opiumtinktur*, G.

Preparation.—Powdered Opium 100 Gm.; Cinnamon, in No. 60 powder, 10 Gm.; Cloves, in No. 30 powder, 10 Gm.; Alcohol 150 Cc.; White Wine a sufficient quantity; to make 1000 Cc. Mix the alcohol with 850 Cc. of white wine. To the mixed powders add 900 Cc. of the menstruum, and macerate the mixture during seven days with occasional agitation. Then transfer it to a filter, and when the liquid has drained off gradually pass through the filter, first the remainder of the menstruum, and afterward enough white wine to make the product measure 1000 Cc.—*U. S.*

To make 1 pint of wine of opium use 730 grains of powdered opium and 73 grains each of cloves and cassia cinnamon; macerate for seven days with 14½ fluidounces of the menstruum (alcohol 15 volumes, white wine 85 volumes). After filtration pass enough menstruum through the filter to bring the volume up to 16 fluidounces.

Each Cc. represents 0.1 Gm. (or 1 fluidrachm about 5.7 grains) of opium.

The U. S. P. requires that 100 Cc. of wine of opium, when assayed by the process given under Tinctura Opii, shall yield from 1.3 to 1.5 Gm. of crystallized morphine.

Extract of opium 1 oz. av.; cinnamon-bark, bruised, cloves, bruised, each 75 grains; sherry 1 pint (Imperial).—*Br.*

Both pharmacopœias have discarded the use of saffron, which is still retained by the French and German Pharmacopœias. Otherwise, the preparation is now practically identical as ordered by the four pharmacopœias. The wine has been replaced in the P. G. by a diluted alcohol. The other formulas are: Opium 200, saffron 100, Ceylon cinnamon 15, Cloves 15, wine 1600 Gm.—*F. Cod.* Opium 30, saffron 10, Chinese cinnamon 2, cloves 2, alcohol (sp. gr. 0.894) 150, and water 150 parts.—*P. G.* That of the French Codex, being made with a sweet wine, is denser (sp. gr. 1.05 to 1.07) than the other preparations. On keeping, this wine deposits some extractive matter and occasionally some narcotine.

Laudanum de Rousseau, *F. Cod.*, contains about one-fourth its weight of opium, and is therefore considerably stronger than the preceding: it is made by fermenting a mixture of opium 200 Gm., honey 600 Gm., water 3 liters, and beer-yeast 40 Gm.; the filtered liquor is then evaporated to 600 Gm. and mixed with alcohol (sp. gr. 0.913) 200 Gm.

Uses.—This preparation, also known as "Sydenham's laudanum," is much superior to the tinctures of opium as an internal medicine, on account of its being less apt to nauseate and less offensive in taste and smell. Gm 0.60–1 (♏ x to gtt. xvj) may be given as a full *dose*. It is sometimes used as an application to the *conjunctiva* in granular and other chronic forms of inflammation of that membrane.

VINUM QUININÆ, *Br.*—Wine of Quinine.

Vin de quinine, Fr.; *Chininwein*, G.

Preparation.—Take of Sulphate of Quinine 20 grains; Citric Acid 30 grains; Orange Wine 1 pint (Imperial). Dissolve first the citric acid, and then the sulphate of quinine in the wine; allow the solution to remain for three days in a closed vessel, shaking it occasionally; and afterward filter.—*Br.*

Allied Preparation.—Vinum de cinchona, *F. Cod.*; Vinum chinæ, *P. G.* 1882. Tincture of cinchona 100, glycerin 100, sherry wine 300 parts.—*P. G.* 1882. Cinchona 5, alcohol (sp. gr. 0.913) 10, red wine 100 parts.—*F. Cod.* The latter formula is alike for pale, red, and yellow cinchona, and in each case the cinchona wine may also be prepared with a strong wine (vin de liqueur), such as Grenache, Lunel, Malaga, Madeira, and others, in which case no alcohol is added.

Uses.—It is difficult to perceive the advantages of this preparation over an extemporaneous solution of the citrate of quinine in water. The *dose* is Gm. 16–32 (f℥iv–℥j).

VINUM RHEI, *Br.*—Wine of Rhubarb.

Tinctura rhei vinosa, P. G.; *Tinctura rhei Darelii.—Vin de rhubarbe*, Fr.; *Weinige Rhabarbertinktur*, G.

Preparation.—Rhubarb-root, in coarse powder, 1½ av. oz.; canella-bark, in coarse powder, 60 grains; sherry 1 pint. Macerate for seven days in a closed vessel, with occasional agitation; then strain, press, filter, and add sufficient sherry to make 1 pint

(Imperial).—*Br.* Rhubarb, in No. 30 powder, 10 parts; Calamus, in No. 30 powder, 1 part; Stronger White Wine a sufficient quantity; to make 100 parts. Moisten the mixed powders with 5 parts of stronger white wine, pack the mixture in a conical glass percolator, and gradually pour enough stronger white wine upon it to make the filtered liquid weigh 100 parts.—*U. S.* 1880.

Rhubarb 6 parts; Grenache wine 100 parts.—*F. Cod.* Rhubarb, finely cut, 8 parts; bitter orange-peel 2 parts; cardamom 1 part; sherry wine 100 parts; in 7 parts of the tincture dissolve 1 part of sugar.—*P. G.*

Uses.—Wine of rhubarb has the same general virtues as the tincture of rhubarb, but is less stimulant. It may be described as cordial, carminative, and *laxative*, and may be used by persons of a *constipated* habit and gouty constitution, and especially by females who add to these conditions scanty and painful menstruation and leucorrhœa. The *dose* is Gm. 4–16 (fʒj–iv).

VINUM RUBRUM, *U. S.*—Red Wine.

Vin rouge, Fr.; *Rothwein*, G.; *Vino tinto*, Sp.

An alcoholic liquid made by fermenting the unmodified juice of the fresh, colored fruits of Vitus vinifera (nat. ord. Vitaceæ) in presence of their skins. When red wine is prescribed without further specification, it is recommended that a dry red wine of domestic production (such as a native Claret, Burgundy, etc.) be employed. Red wine should be preserved in well-closed, full casks or in well-stoppered bottles in a cool place.—*U. S.*

Origin and Description.—The fruits of most cultivated varieties of the American grapevines and of numerous varieties of the European species have either an amber color or are purple, dark-blue, or nearly black. The juice of these grapes is colorless or nearly so, and if fermented alone yields a white wine, but if fermented with the pericarp or skins the coloring matter of the latter is extracted, and the wine has a red color, varying in shade with the variety of grapes, with the quantity of skins, the length of time they have been in contact with the fermenting liquid, and with the amount of alcohol and acid present. Although many white wines contain tannin, taken up from the pericarp of the fruit or from the seeds, the quantity is usually minute as compared with that present in red wines, and which comes from the same sources. It is obvious, therefore, that red wine agrees in properties and composition with white wine, except so far as these are modified by the red coloring matter and the tannin, the most striking differences being the deep-red color, the distinctly astringent taste, and the effect produced by alkalies, ferric chloride, lead acetate, and other reagents, either changing the color of, or producing precipitates with, tannin and the coloring principle.

Vinum portense.—Port wine, *E.*; Vin d'Oporto, *Fr.*; Portwein, *G.*—This is the product of the grape cultivated in the district near the river Douro in Portugal, and is chiefly exported from Oporto. When recently made it is of a red color, which by age changes to a deep reddish-brown, while at the same time a considerable portion of altered astringent matter is deposited and the wine acquires its full flavor. Port wine is considered to be best when about eight or ten years old. As exported from Portugal, it is always mixed with a certain quantity of spirit, which is added for the purpose of better preservation; its alcoholic strength is thereby increased from 18 to 22 per cent. Ripeness and strength are said to be imparted to new wine by adding brandy toward the end of fermentation, and the product, particularly the cheaper varieties of port wine, is often artificially colored with preparations containing the juice of elderberries. Port wine has a pleasant vinous odor and an agreeable, warm, sweetish, and slightly astringent taste. In the place of true port wine a variety of French wine, known in commerce as *Burgundy port wine*, is much used in the United States; it resembles port wine in appearance and flavor, and contains about 14 or 16 per cent. of alcohol. California port wine is very similar, and is the product of grapevines originally obtained from the port-wine district of Portugal, and chiefly cultivated in Los Angelos county. Similar wines are also made in other parts of the United States.

Claret is the English name of dry red wines containing a moderate amount of alcohol, and was originally used for French red wines (*vin clairet*, clarified wine), but is now applied to many wines of American growth from California, as well as from the Mississippi Valley and eastward to the Atlantic coast. Some of the most esteemed red wines of France are produced in Gironde and exported from Bordeaux, and the red wines produced in other sections of France have, like the former, been known in Europe as *Bordeaux wines*. Much of the wine exported is more or less artificial, and the handsome

red color is now sometimes due to *maqui-berries*, the fruit of Aristolelia Maqui, *L'Héritier* (nat. ord. Tiliaceæ), of which 431,392 kilos were exported from Chili to Europe in 1887, about three-fourths of which went to France (*Kew Bulletin*, Feb. 1890). (See VINUM ALBUM, process of Petiot and Gall for wine-improving.)

Constituents.—In addition to the constituents mentioned elsewhere (see VINUM ALBUM), red wine contains tannin, partly derived from the casks, but mainly from the seeds and integuments of the grape, and giving with ferric salts green-brown or green-black precipitates. The red coloring matter, *œnolin* or *œnolic acid*, is a red-brown or purplish-red powder, which is nearly insoluble in water, in carbon disulphide, and in chloroform, but soluble in dilute acids and in alcohol; it is not unlikely that the coloring principles of different grapes vary, and are more or less modified by the constituents and treatment of wine.

The following summary of analyses of American red wines by Prof. H. B. Parsons shows the variation in composition:

	64 Dry Wines.			12 Port Wines.		
	Average.	Highest.	Lowest.	Average.	Highest.	Lowest.
Specific gravity	.9933	1.0011	.9894	1.0261	1.0508	1.0116
Alcohol, per cent., weight	8.92	12.21	5.71	13.23	16.93	10.25
" " volume	11.04	15.21	7.17	17.09	21.89	13.05
Total residue	2.28	3.16	1.65	11.17	17.04	6.89
Total ash	.231	.532	.130	.283	.355	.139
Glucose	trace.	.450	none.	8.05	11.80	4.15
Total acid, as tartaric	.723	.997	.511	.632	.828	.370
Fixed acid, as tartaric	.360	.646	.226	.356	.600	.196
Volatile acid, as acetic	.290	.517	.138	.216	.386	.128

Tests.—The pharmacopœial requirements as to the quality of red wines are practically identical with those for white wines, but additional tests are prescribed for ascertaining the nature of foreign coloring matters: "Using eosin test-solution or fluorescein test-solution as indicator, 50 Cc. of red wine should require for complete neutralization not less than 3 nor more than 5.2 Cc. of normal potassium hydroxide solution (limit of free acid). If 10 Cc. of red wine be diluted with an equal volume of water, and treated with 5 drops of ferric chloride test-solution, the liquid should acquire a brownish-green color (due to tannic acid). With lead acetate test-solution red wine forms a heavy precipitate which may vary in color from bluish-green to green. If 2 Cc. of red wine be mixed, in a test-tube, with 2 drops of chloroform and 4 Cc. of normal potassium hydroxide solution, and the mixture carefully heated, the disagreeable odor of isonitril should not become perceptible (absence of various aniline colors). If 50 Cc. of red wine be treated with a slight excess of ammonia-water, the liquid should acquire a green or brownish-green color; if it be then well shaken with 25 Cc. of ether, the greater portion of the ethereal layer removed, and evaporated in a porcelain capsule with an excess of acetic acid and a few fibres of uncolored silk, the latter should not acquire a crimson or violet color (absence of fuchsine). If 25 Cc. of red wine, heated to about 45° C. (113° F.), be well agitated with 25 Gm. of manganese dioxide, the liquid filtered off and acidulated with hydrochloric acid, it should not acquire a red color (absence of sulpho-fuchsine).

"Tested by the following method, red wine should be found to contain not less than 10 nor more than 14 per cent. by weight (equivalent to 12.4 to 17.3 per cent. by volume), of absolute alcohol: Take the specific gravity (to four decimals) of a sufficient portion of the red wine at the temperature of 15.6° C. (60° F.), evaporate the wine in a tared capsule to one-third of its original weight, cool, and add water until the liquid measures its original volume at 15.6° C. (60° F.); then take the specific gravity (to four decimals) again. The difference between the two specific gravities, deducted from 1.0000, corresponds to the specific gravity of an alcohol containing the same percentage of absolute alcohol, by weight or volume, as the wine under examination, the corresponding percentage being ascertained by referring to the alcoholometric tables."—*U. S.*

On the gradual addition of ammonia the red color of wine is changed to purple, blue-green, and is destroyed, with the production of a brown tint. Many other organic coloring matters have a similar behavior, while others are changed to purple (cochineal, logwood). The precipitate produced by lead subacetate is dingy gray, with a blue or green tint; the age of the wine and the presence of tannin and other constituents influence the shade of the color. Other organic coloring matters are precipitated by the same reagent red

(Brazil-wood), green (elderberries), or blue (logwood). Similar shades of color are produced upon white filtering-paper which has been steeped in a solution of lead acetate. According to Andrée (1880), the coloring matter of huckleberries is identical with that of wine, and in order to detect the addition of the juice of these berries it is necessary to show the presence of citric acid. (See VINUM ALBUM.)

Pastrovich (1882) again recommends manganese dioxide, which was originally suggested by Facen (1870), and states that, after repeated agitation with the oxide, after fifteen minutes genuine red wine, also wine colored with huckleberries, elderberries, or cochineal, becomes nearly colorless, while the color of Brazil-wood, logwood, and orchil changes to brownish-yellow, and that of the fuchsine remains unaltered. Wine containing only .002 Gm. of fuchsine to the liter, treated in this manner, yields a rose-colored filtrate.

Action and Uses.—(The action of the alcoholic elements of wine has been treated of under ALCOHOL and VINUM ALBUM.) The essential difference between red and white wines consists in the presence of tannic acid in the former, which is derived from the crushing of the skins of purple grapes in the process of manufacturing wine. This ingredient is most abundant in port and heavy Bordeaux wines, and hence they and the other wines that resemble them, including several American varieties, differ from white wines in the relative slowness of their absorption from the stomach, and consequently in their less prompt production of intoxication. Moreover, from the same cause they act less injuriously upon the coats of the stomach. Red wines, in general, have relatively more of the tonic and less of the excitant properties possessed by white wines, and are especially to be preferred to the latter when a sustained instead of a transient stimulation is desired, and when, in addition to this, an astringent action is intended. Hence the red wines are eminently the wines of convalescence, and are of general use in all cases of excessive discharges of blood, pus, etc. in which they are not contraindicated by other reasons. Unfortunately, red wines are more generally adulterated or factitious than white wines, with the exception of sherry. In an English manual for wine-dealers it is said: "To keep wine from turning sour put in the casks 2 pounds 3 ounces of small shot." And, as if this were not villainous enough, it proceeds: "In extreme cases, when all previous recipes have been tried without any satisfactory result, take a pinch of oxalic acid and put it into the bottle" (*Brit. and For. Med.-Chir. Rev.*, Apr. 1858, p. 324). Red wines are often manufactured out of alcoholic dilutions colored by logwood, rhatany, beets, litmus, etc. Astringency is given them by means of alum, oak- or willow-bark, etc., as is elsewhere more particularly described.

The more astringent red wines are used for injecting *hydroceles*, the *vagina*, *urethra*, etc. affected with chronic profluvia, *fistulous sinuses*, etc. But the various astringent tinctures would answer equally well.

VIOLA TRICOLOR.—VIOLA TRICOLOR.

Herba violæ tricoloris, P. G.; *Herba jaceæ.—Pansy*, *Heart'sease*, E.; *Pensée sauvage*, F. Cod.; *Stiefmütterchen*, *Freisamkraut*, *Dreifaltigkeitskraut*, G.; *Trinitaria*, Sp.

The wild-grown flowering herb of Viola tricolor, *Linné*.

Nat. Ord.—Violaceæ.

Origin.—The violets are mostly perennial, or rarely annual or biennial, herbs, with alternate stipulate leaves, and with axillary flowers having five persistent auriculate sepals, five somewhat unequal petals, of which the lower one is saccate or spurred, five strongly connivent stamens, of which the two lower ones bear a spurred nectary upon the back, and one superior pistil with three placentas, ripening into a three-valved, many-seeded capsule; the globular or ovate seeds have a small caruncle and hard testa, and contain a straight embryo imbedded in fleshy albumen. The species official in the Pharmacopœia of 1880 is an annual or biennial indigenous to Europe and Northern Asia, naturalized in the United States, and frequently cultivated in many varieties as an ornamental plant. Only the wild-grown plant is to be collected.

Description.—Pansy has a thin, spindle-shaped root and an erect or ascending angular and branching, nearly smoooth stem, 10–20 Cm. (4 to 8 inches) high. The leaves vary between roundish-cordate and oval, crenate and nearly entire, are about 25 Mm. (1 inch) long, petiolate, and have prominent, leaf-like, lyrately-pinnatifid stipules. The flowers are on long peduncles, and have the corolla partly yellowish, blue, and purple, or occasionally variegated and longer than the calyx (variety vulgaris, *Koch*), or the corolla scarcely exceeds the calyx, and is yellowish or occasionally partly purplish (var. arvensis,

Murray). The last form is the only one recognized by the French Codex; it is frequent in sandy fields of North America, and apparently indigenous. The dry herb is inodorous and has a bitterish, mucilaginous, and slightly acrid taste, the acridity residing mainly in the root.

Constituents.—Boullay (1824) found in the herb a yellow coloring matter and much mucilage, but no violine; Cuseran (1847), in addition to these, sugar, bitter principle, resin, and potassium nitrate. Mandelin (1879) detected free *salicylic acid* in this plant, and subsequently (1881) determined it to amount to .1068 per cent. in the wild-grown, air-dry plant of the variety arvensis, while other varieties contained less, and the cultivated plant only .043 per cent. The acid is obtained by agitating the aqueous solution of the alcoholic extract with ether; the petals contain a minute quantity, the seeds a mere trace, of the acid. A salt of salicylic acid could not be found. Mandelin examined also the yellow coloring matter, which is the glucoside *violaquercitrin*, yielding with dilute acids 3 molecules of sugar and 1 of quercetin, besides a fluorescing compound.

Allied Species.—Viola pedata, *Linné*, Bird's foot violet. The leaves and rhizome were formerly official. It grows in sandy soil from the New England States southward, and westward to the Mississippi. It has a short, erect, and truncate rhizome, about 25 Mm. (1 inch) long and nearly as thick, and beset with slender rootlets. The leaves are radical, smooth, pedately five- or seven-parted, and have the divisions linear or narrowly spatulate, and occasionally slightly toothed at the apex. The flowers are large, about 25 Mm. (1 inch) broad, beardless, vary in color between light-blue and dark-purple, and have a very faint violet color, which is observable only with a large number of flowers. The leaves and flowers have a mucilaginous and sweet taste; the taste of the rhizome is mucilaginous, bitter, and somewhat acrid. The plant flowers in May, and frequently a second time in August and September.

Viola cucullata, *Aiton*, is the common blue violet of North America, growing in meadows and in dry grassy places and open woods. The rhizome is spreading, forms compact masses, and is covered with numerous short fleshy branches. The leaves are very variable, heart-shaped at the base, with the basal lobes rolled up. The flowers are somewhat bearded, light- or dark-blue, violet-colored, or variegated. The variety V. palmata has the later leaves palmately lobed.

Viola odorata, *Linné* (Bentley and Trimen, *Med. Plants*, 25).—Sweet-scented violet, *E.*: Violette odorante, *Fr. Cod.*: Märzveilchen, *G.*: Violeta, *Sp.*—It is indigenous to Europe and Northern Asia, is frequently cultivated, and grows to a certain extent spontaneously in various parts of North America. It has an oblique rhizome and produces long, filiform runners. The leaves are reniform or heart-shaped, obtuse, and crenate. The flowers are dark-blue or sometimes whitish, bearded, and have a very agreeable odor. For pharmaceutical purposes the dark-blue flowers alone are collected, deprived of the calyx, and only the corolla is used in the fresh state for preparing

Syrupus violæ odoratæ, *P. Cod.* Fresh violet-petals 10 parts, boiling water 20 parts; in 21 parts of the infusion dissolve 38 parts of sugar.

The rhizomes of the perennial, and more particularly the acaulescent, violets appear to contain *violine*, which Boullay (1828) obtained from all parts of the sweet-scented violet, but in largest quantity from the rhizome. It is prepared by removing from the alcoholic extract chlorophyll and fat by means of ether, boiling the residue with diluted sulphuric acid, adding to the filtrate lead oxide, evaporating, and exhausting the residue with strong alcohol. Violine is a yellowish, bitter, and fusible powder, which is more readily soluble in water than emetine, but less so in alcohol; is insoluble in ether, and appears to combine with acids to not well-defined saline compounds. It merits further investigation. The blue coloring matter of violets turns green, and afterward yellow, with alkalies.

Anchietea salutaris, *Saint-Hilaire*, s. Noisettia pyrifolia, *Martius*. The root of this shrub, which is indigenous to Brazil, is used as a cathartic and emetic. It is about the thickness of a finger, is brownish-red, and has a yellowish, nauseous, and bitter bark, covering the hard brownish wood. Peckolt (1859) found in the root starch, sugar, gum, tannin, a little resin, and about $\frac{2}{5}$ per cent. of *anchietine*, which forms crystallizable salts, crystallizes in straw-colored needles, is insoluble in ether, sparingly soluble in water, and freely soluble in alcohol, and acquires with sulphuric acid a violet color, turning black. Anchietea salutaris is believed in Brazil to be useful in *syphilis* and *skin affections*, probably upon the ground of its provoking salivation. It has been administered in powder and in tincture.

Uses.—Very little is known of the special medicinal virtues of the formerly officinal violet, V. pedata, but, as far as can be judged, it did not differ much in its qualities from the European species, which have long been used in medicine. Sweet violets (V. odorata) were anciently held to be refrigerant and astringent in "ardor of the stomach," inflammation of the eyes, and prolapse of the anus and of the uterus, and also to restrain suppuration. By the Arabians they were employed in coughs and affections of the kidneys and of the liver, and, when prepared with sugar, as a laxative. The syrup of vio-

lets, which to this day is used in France, was directed by the Arabians in pulmonary affections. It was also formerly recommended as a local remedy for *aphthæ;* internally, an infusion of the flowers was given in infantile *convulsions;* and the powder, as well as an infusion of the root, has been used in the same manner as ipecacuanha in the treatment of infantile *dysentery.*

An alkaloid procured from this species is represented to have exhibited the properties of emetine, causing vomiting, purging, and great prostration in dogs, and in man analogous effects in some cases, but not uniformly. The powdered root applied to the denuded skin has sometimes acted as an emeto-cathartic. Similar effects have been obtained from V. canina.

V. tricolor (heart'sease) also produces disturbance of the stomach and bowels, and sometimes diuresis. Its continued use is said to occasion sweating and a pustular eruption of the skin, and to impart to the urine a smell like cat's urine or that of conium. It once had a great popular repute in Europe as a purifier of the blood and as a remedy in chronic *bronchial* and *intestinal catarrh*, in *cutaneous eruptions*, and particularly in *crusta lactea* (eczema infantile). In these affections it was administered in a decoction of milk and applied in fomentations. Cazin (*Traité des Plantes médicinales indigènes de France*, 2ème éd., p. 734) sets forth at length the virtues ascribed to it in the cure of scrofulous and other cutaneous diseases by Bergius, Matthiolus, Bauhin, Boeckler, Strack, Murray, Hufeland, and many others, including the imaginative Hahnemann, and also the denial of their existence by other physicians. A similar history had long before been given by Richter (*Ausführliche Arzneim.*, ii. 235), who concludes it by observing, "After all, viola has no special virtues in these affections; at the best, it can only afford some support to other and more efficient remedies." It had also some repute in constitutional *syphilis.* In Europe the syrup of violets is sometimes employed as a laxative for infants, but its chief use is to give a fine color to mixtures. V. sagittata is a reputed antidote to snake-bites.

VISCUM.—Mistletoe.

Gui de chêne, Gillon, Fr.; *Mistel*, G.; *Visco, Muérdago*, Sp.

Viscum album, *Linné*, and Viscum (Phoradendron, *Nuttall*) flavescens, *Pursh.*

Nat. Ord.—Loranthaceæ.

Origin and Description.—The mistletoes are small parasitic evergreen shrubs, growing mostly upon deciduous-leaved trees, and penetrating with their simple roots through the bark into the wood. Viscum album is indigenous to Europe, and is chiefly found upon apple, pear, plum, and similar trees, but grows also upon poplars, birches, beeches, and others. Viscum flavescens is an American species, growing upon oaks, elms, apples, etc. in the Southern United States and northward to New Jersey, and westward in the Mississippi Valley. Both plants are of a yellowish-green color 15–60 Cm. ($\frac{1}{2}$ to 2 feet) high, much branched, jointed, and have opposite, often scale-like leaves and monœcious or diœcious flowers in small clusters or short spikes. The leaves of the European species are lanceolate or spatulate, obtuse and entire; those of the American plant are obovate or oval. The fruit of both species is a small, whitish, one-seeded berry. The branches are usually collected. They have an unpleasant heavy and rather weak odor and a mucilaginous, sweetish, bitter, and somewhat astringent taste.

Loranthus europæus, *Linné*, is the *viscum quernum* of ancient writers. It is a somewhat larger and thicker shrub, which grows upon oaks and chestnuts in Eastern and Southern Europe, and has a grayish or dark-brown bark and pale-yellow berries.

Constituents.—Mistletoe has been analyzed by Gaspard, Funcke, Winckler, Macaire, and Reinsch. It contains mucilage, sugar, an odorous principle, fixed oil, resin, traces of tannin, and various salts. The most interesting constituent is *viscin*, also called *bird-lime*, or more properly *bird-glue*, from the German name *Vogelleim.* It is insoluble in water, alcohol, and fixed oils, but dissolves in ether and oil of turpentine, and, on evaporating the solvents, remains behind as a yellowish viscous and tenacious mass. It seems to be present in the mistletoe in small proportions, but a larger quantity is formed by a kind of fermentation. The same or a similar compound may be obtained from the inner bark of the European holly, Ilex aquifolium, *Linné*, from the root of Gentiana lutea, *Linné*, and from other plants. It is employed for catching small birds; hence the name *Vogelleim.*

Action and Uses.—The operation of mistletoe is as uncertain as its virtues are doubtful. The berries are reported by some writers (Cazin) to be innocuous, but others state that they are emetic and purgative, and instances are given in which very young children have suffered convulsions, and even death, from eating large quantities of them.

It seems not impossible that these effects may have been due to indigestion alone. It is true that a case is recorded in which after several children had eaten the berries of V. flaveseens they were affected with vomiting, great thirst, tenesmus, and bloody and mucous stools. In one case death ensued in a state of collapse. In Europe, however, the dried young twigs and leaves of mistletoe have long been used in medicine for various nervous affections, including *chorea*, *asthma*, and *spasmodic colic*, but chiefly for *epilepsy*, although sometimes for *hysteria* (Richter, *Ausf. Arzneim.*, ii. 822). Long (*New Preparations*, 1878) "used mistletoe in the forms of infusion, tincture, decoction, and fluid extract in many cases of *menorrhagia* and *post-partum hæmorrhage* with gratifying results." He conceived that it incited the natural rather than the tonic contraction of the uterus. A physician in South Carolina refers to three cases of abortion in negroes produced by this growth (*Med. Record*, xvii. 276). In 1881 it was alleged to act upon the heart like digitalis (Park, *Practitioner*, xxvii. 346). It was formerly given in powder in the *dose* Gm. 0.60–4 (gr. x–lx), or in a decoction made from Gm. 16–64 in Gm. 250 (℥ss–ij in ℥viij) of water, and in tablespoonful doses several times a day.

VITELLUS, *U. S.*—Yolk (Yelk) of Egg.

Ovi vitellus, Br.; *Jaune d'œuf*, Fr.; *Eidotter, Eigelb*, G.; *Yema de huevo*, Sp.

The yolk of the egg of Gallus Bankiva, var. domestica, *Temminck*, s. Phasianus Gallus, *Linné*.

Class Aves; *order* Gallinæ.

Origin.—The domestic fowl originated from the *red jungle-fowl*, G. Bankiva, which inhabits Java and the adjacent islands, Northern India, Cochin China, and the Philippines. At the present time numerous varieties of it are found in all civilized countries. The egg (Ovum *U. S.* 1870, Ovum gallinaceum; Egg, *E.*; Œuf de poule, *Fr.*; Ei, *G.*; Huevo, *Sp.*) consists of the shell and lining membrane 10.7 parts, albumen 60.4 parts, and yelk 28.9 parts (Prout, 1822).

Description and Composition.—1. Testa ovi.—Egg-shell, *E.*; Coquille, *Fr.*; Eierschale, *G.*—It consists, according to Prout, of 97 parts calcium carbonate, 1 part calcium and magnesium phosphates, and 2 parts organic matter. Vauquelin's results were 89.6, 5.7, and 4.7 respectively.

2. Albumen ovi, *Br.*—White of egg, *E.*; Blanc d'œuf, *Fr.*; Eiweiss, *G.*; Clara de huevo, *Sp.*—It consists of two or three laminæ, the total average weight being 23.01 Gm. (Lehmann), or 24.8 Gm. (Poleck), and contains 82 to 88 per cent. of water, and on the average 13.32 of solid constituents, including 0.65 of ash, as well as minute traces of fat, sugar, and extractive. The ash of the egg albumen consists of 42 per cent. of potassium chloride, 9 of sodium chloride, 12 of carbonic acid, the remainder being phosphates and sulphates of the alkalies, silica, iron, lime, and magnesia. The organic portion of the white, the *albumen* proper, is a protein compound; the average elementary composition is 53.7 C, 15.5 N, 7.1 H, 22.1 O, and 1.6 S. Its aqueous solution rotates the plane of polarized light to the left, and may be evaporated in thin layers below 50° C. (122° F.) without change, but on being heated to near 75° C. (176° F.) it is coagulated and becomes insoluble in water. Albumen is precipitated from its solutions by most mineral and by some organic acids, but not by phosphoric or acetic acid. It is soluble in caustic alkalies, and precipitates the salts of most heavy metals, hence its value in cases of poisoning by salts of mercury, copper, etc. Albumen is also precipitated by volatile oils, camphor, phenol, and by tannin, the last precipitate being soluble in an aqueous solution of tannin. Alcohol coagulates albumen, and ether precipitates it, the precipitate being only partially soluble in water. Farsky (1878) succeeded in obtaining what appears to be a definite compound of salicylic acid with albumen, by stirring the two together for some time, washing with ether and hot water, and drying in an air-bath at about 120° C. (248° F.); it was found to contain 14.16 per cent. of salicylic acid and 85.84 of albumen, and to be as easily digestible as the uncombined albumen. When boiled with *Millon's reagent* the precipitate as well as the liquid turns red, and albumen cautiously heated with strong hydrochloric acid is colored violet-blue. Other protein compounds show a like behavior.

Albumen ovi siccum, P. G.—The dried egg-albumen is either in translucent, horny masses, similar in appearance to acacia, or in a yellowish powder, which is inodorous and tasteless, and forms with water a turbid, neutral solution, but is insoluble in alcohol and ether. 5 Cc. of an aqueous solution (1 to 1000) to which 10 drops of nitric acid have been added should yield when warmed a copious precipitate of coagulated albumen. If to 10 Cc. of the aqueous solution (1 to 100) 5 Cc. of solution of carbolic acid, and then

5 drops of nitric acid, be added and well shaken, the mixture should yield a clear filtrate. If 5 Cc. of alcohol be added to an equal volume of this filtrate, so that they form two layers, a milkiness should not make its appearance at the line of contact; 5 Cc. of the foregoing filtrate should not be colored red, but only yellow, with 1 Cc. of solution of iodine.—*P. G.*

3. Vitellus ovi.—The yolk is a viscid yellow or reddish-yellow opaque liquid, which is without odor, has a bland taste, an alkaline reaction, and must be regarded as a dense emulsion consisting of oil suspended in water by means of albumen. When triturated with water a whitish emulsion is obtained; the addition of alcohol causes it to coagulate, and when agitated with ether it separates a white mass and yields to ether an orange-yellow fat. Yolk is coagulated by heat. It contains 48 to 55 per cent. of water, 16 to 18 per cent. of *vitellin* (which is probably a proteid closely related to casein, and mixed with about one-fourth of albumen), 29 to 31 per cent. of fat (21.3 parts of which are olein and margarin, according to Gubley), 1.5 per cent. inorganic salts, coloring matter, a small portion of sugar, and 0.42 of cholesterin. Gubley has separated from the ethereal extract of yolk a substance which he named *lecithin*, and which on boiling with baryta yields *neurine* and stearic and *phosphoglyceric acids*. The fat obtained by expressing the coagulated yolk or by exhausting it with ether is occasionally used under the designation of *oleum ovi* (Oil of eggs, *E.*; Huile d'œufs, *Fr.*; Eieröl, *G.*).

Preservation.—Eggs may be preserved for a considerable length of time by covering the shell with a substance impervious to water, thus closing the pores so as to exclude the air. This may be done by wax, fat, paraffin, gum, or by similar substances. Packing them with the small end downward in dry salt, milk of lime, etc. has likewise been recommended.

Pharmaceutical Uses.—The white of egg is used for the clarification of syrups, honey, and other liquids. The yolk is employed for emulsionizing fixed and volatile oils and camphors.

Action and Uses.—*Egg-shells* were long used for the various purposes to which chalk is now applied internally. Like crabs' eyes and claws, corals, and oyster-shells, which were formerly employed, they contain a certain proportion of animal matter which mitigates the action of the calcareous constituent. They were an ingredient of a secret remedy for *gravel*, for a knowledge of which the British Parliament paid an extravagant sum of money. The *white of egg* forms with solutions of corrosive sublimate and of copper sulphate compounds which are nearly insoluble, and hence it has been used in *poisoning* with these salts, first to neutralize and then to evacuate them. Its demulcent and protective action is also advantageous. It is applied to the treatment of *burns* and *erysipelas*, either alone or emulsified with oil, or coagulated by alum in the form of alum curd. The latter is an excellent application in acute *conjunctivitis*. Diluted with water, sweetened, and flavored, fresh egg albumen forms an agreeable and useful drink in numerous cases of *gastro-intestinal* inflammation and irritation. Albumen is sometimes used as a substitute for starch in the application of fixed *bandages*. The *yolk of egg* is more nutritious and digestible than the white, and is habitually employed whenever it is desired to give the largest amount of nutriment in a small bulk and in the most digestible form. The yolk of a hard boiled fresh egg readily crumbles, and is therefore easily acted upon by the gastric juice. The fresh yolk, beaten with sugar and mixed with hot water, and with the addition of a little brandy and nutmeg or cloves, forms a customary draught at the commencement of catarrhal and rheumatic (muscular) affections. It is used also to make emulsions for the administration of castor oil, cod-liver oil, oil of turpentine, etc., either by the mouth or the rectum. Externally, it is sometimes, and very usefully, employed as a dressing for *burns*, *scalds*, *abrasions*, etc., and to soften the crusts of *cutaneous eruptions*, *cerumen* in the auditory canal, etc.

WINTERA.—Winter's Bark.

Cortex winteranus.—*Écorce de Winter*, F. Cod.; *Cannelle de Magellan*, Fr.; *Winter's Zimmt*, G.; *Corteza winterana*, Sp.

The bark of Drimys Winteri, *Forster*, s. Wintera aromatica, *Murray*.

Nat. Ord.—Magnoliaceæ, Winteræ.

Origin.—Drimys Winteri is a small tree growing in the western part of South America from the Straits of Magellan northward to Mexico. It has coriaceous, oblong and obtuse or lance-oblong, dark-green, and on the lower side pale bluish-green, entire leaves, axillary clusters of whitish flowers, and about four or eight black obovate berries

containing three or four seeds. D. mexicana, *Sessé*, s. Chilensis, *De Candolle*, and D. granatensis, *Linné filius*, are now regarded as varieties, and the last one is mentioned by the French Codex as the present source of the drug.

Description.—Winter's bark is curved or in quills, between 5 and 8 Mm. ($\frac{1}{5}$ and $\frac{1}{3}$ inch) thick, externally of a gray or whitish color with brown patches, and underneath the corky layer brown. The inner surface is brown, and marked with longitudinal ridges from the prominent bast-fibres. The bark breaks with a short fracture, and has a peculiar odor and a warm and very pungent taste. The transverse section is of a brown-red color, mottled with whitish sclerenchyma, which in the primary bark underneath the thin corky layer forms transversely-elongated groups, and in the bast-layer is seen partly in groups, partly in long radial lines; resin-cells are scattered in the outer and inner tissue.

Substitutions.—The Winter's bark of commerce has usually been an entirely different bark, occasionally that of Canella alba, *Linné*, but more frequently obtained from Cinnamodendron corticosum, *Miers* (see page 392).

Constituents.—The principal constituents of Winter's bark, as ascertained by Henry (1820), are 1.2 per cent. of volatile oil, about 10 per cent. of pungent resin, and 9 per cent. of tannin, with extractive matter and a little starch.

Allied Species.—The Australian species, Drimys axillaris, *Forster*, and D. lanceolata (Tasmania aromatica, *R. Brown*), have likewise pungently aromatic barks, and the fruit of the latter is used like pepper.

Action and Uses.—The action and uses of Winter's bark resemble those of cascarilla and canella. It is a warm tonic of the digestive organs, increasing the appetite and improving the digestion, especially when deranged by *flatulence* and *colic*. The *dose* of the powder is Gm. 2 (gr. xxx), and a vinous infusion may be prepared by displacement with Gm. 30 (℥j) of the bark to Gm. 360 (℥xij) of sherry wine.

XANTHORRHIZA.—Yellow-root.

The rhizome and root of Xanthorrhiza apiifolia, *L'Héritier*. Bentley and Trimen, *Med. Plants*, 9.

Nat. Ord.—Ranunculaceæ.

Origin.—This plant is also known as *shrub yellow-root* to distinguish it from Hydrastis canadensis. Xanthorrhiza is a shrub 30–60 Cm. (1 to 2 feet) high, growing in shady places near streams in New York and from the mountains in Pennsylvania southward to the Gulf of Mexico. The clustered stems are thin, of a grayish color externally, smooth, and annulate from the distant leaf-scars. The leaves are alternate, crowded at the ends of the branches, long-petiolate, pinnate, and have three or five ovate or lanceolate, cleft, and toothed leaflets, with wedge-shaped bases. The flowers are polygamous and in compound drooping racemes, appearing in early spring.

Description.—Yellow-root consists of a much-branched and bent rhizome several feet long. The thicker portions are about 12 Mm. ($\frac{1}{2}$ inch) in diameter, the branches thinner, some being only 1.5 Mm. ($\frac{1}{16}$ inch) thick, longitudinally wrinkled, of a light yellowish-brown color externally, and rather sparingly beset with brittle rootlets. The bark is thin, internally of a deep-yellow color, and separates readily from the bright-yellow, tough wood, which is radially striate by medullary rays and encloses a thin central pith. The rhizome breaks with a short fibrous fracture, is inodorous, and has a bitter taste, which is more marked in the cortical portion. Portions of the stems, having a larger brownish pith and yellow wood, are often present.

Constituents.—Perrins (1862) showed that yellow-root contains berberine; he obtained only 7½ grains of the nitrate from 1 pound of the drug. About the same time W. M. Merrill made a similar observation. Whether berberine is associated with a white alkaloid, as is frequently the case, has not been determined. The parenchyma contains starch. The other constituents of the drug are not known.

Uses.—Yellow-root has long been known as an indigenous *tonic* medicine, and compared either to quassia or columbo. It may be given in decoction, tincture, or powder. Of the last the *dose* is said to be Gm. 2.60 (gr. xl).

XANTHOXYLUM, *U. S.*—Prickly Ash.

Toothache tree, Angelica tree, Suterberry, E.; *Clavalier, Frêne épineux*, Fr.; *Zahnwehrinde, Zahnwehholz*, G.

The bark of Xanthoxylum americanum, *Miller*, s. X. fraxineum, *Willdenow*, and of Xanthoxylum clava-herculis, *Linné*.

Nat. Ord.—Rutaceæ, Xanthoxyleæ.

Origin.—Both species of prickly ash are indigenous to North America, and have pinnate leaves and dioecious, tetramerous or pentamerous flowers, the pistillate ones containing from three to five free ovaries, which produce thick and fleshy two-valved and one- or two-seeded capsules.

X. AMERICANUM grows in rocky woodlands and on river-banks from Canada southward to Virginia and North Carolina. It is shrubby, and attains a height of 3–3.6 M. (10 or 12 feet). The leaves have nine or eleven ovate-oblong, nearly sessile, somewhat serrulate, and on the lower surface downy, leaflets. The small greenish flowers are in umbellate, axillary clusters, appear in April before the leaves, and are destitute of a calyx. The capsules are roundish, red, and contain black, shining seeds.

X. CLAVA-HERCULIS is found near the coast from Virginia southward to Florida and westward to Texas and in the West Indies. It is a small tree, but sometimes grows to the height of 9–12 M. (30 or 40 feet). Its leaves have from seven to eleven ovate-lanceolate, crenate-serrulate, unequal-sided, and shining leaflets, the terminal one alone being equilateral. The numerous greenish flowers are in terminal cymes, appear in June after the leaves, and contain three pistils.

Description.—NORTHERN PRICKLY-ASH BARK is in small, curved, or quilled fragments, about 5 Cm. (2 inches) or less long, mostly about 1 Mm. ($\frac{1}{25}$ inch) thick, and occasionally mixed with pieces nearly 3 Mm. ($\frac{1}{8}$ inch) thick. The corky layer is very thin, of a brown-gray color, nearly smooth or faintly furrowed longitudinally, occasionally superficially fissured transversely, and marked with some scattered warts, becoming transversely elongated. Irregular whitish patches are usually observed on the surface of the bark, and numerous minute, black, and shining hemispherical dots, which are the perithecia of a lichen, probably a species of *Verrucaria*. The brown, glossy spines are not numerous, but are about 6 Mm. ($\frac{1}{4}$ inch) long, straight, two-edged, and have a narrow linear base about 18 Mm. ($\frac{3}{4}$ inch) long. The outer bark underneath the corky layer is of a green color, and the inner bark whitish or yellowish. The inner surface is smooth, or finely striate if obtained from older branches. The bark is quite brittle, breaks with a short, non-fibrous fracture, and exhibits upon transverse section a somewhat tangential arrangement of the tissue. It is inodorous, and has a slightly aromatic, bitterish, and strongly pungent taste.

SOUTHERN PRICKLY-ASH BARK resembles the preceding, except that it is about 2 Mm. ($\frac{1}{12}$ inch) thick, and bears on its surface many conical corky projections, which are 1–2 Cm. ($\frac{2}{3}$ to $\frac{4}{5}$ inch) high, and have an oblong or roundish base 25 Mm. (1 inch) or more in length. Sometimes a number of these cones are crowded together. The stout brown spines are situated upon elevated corky bases.

Substitution.—The bark of Aralia spinosa, *Linné*, which plant is known by the same common names as the two species of Xanthoxylum, is sometimes collected in place of the bark of the latter. Aralia-bark is described on p. 274.

Allied Species.—XANTHOXYLUM FLORIDANUM, *Nuttall*, is known as *satin-wood*, and considered to be identical with X. caribæum, *Lamarck*.

X. PTEROTA, *Kunth*, grows from Florida and Texas to Brazil. The wood is yellow, dense, and very hard; the bark and leaves are pungent.

X. ALATUM, *Roxburgh*, of Northern India, X. PIPERITUM, *De Candolle*, a native of Japan, and several other species, yield pungently aromatic fruits which are employed as condiments in the East. The bark, leaves, and fruits of most species are pungent or acrid.

Constituents.—Prickly-ash bark was examined by Dr. Staples (1829), who obtained from it a little volatile oil, a green-colored fixed oil, resin, and other common vegetable principles, and a crystalline body which he named *xanthoxylin*, but the nature of which was not further characterized. The bitter principle of the bark of X. clava-herculis was isolated by Chevallier and Pelletan (1827), and designated as *xanthopicrin*, but was found by Perrins (1863) to be identical with *berberine*. G. H. Colton (1880) examined southern prickly ash, and obtained an alkaloid which seems to differ from berberine; it is yellowish, bitter, soluble in alcohol and water, insoluble in benzin, ether, and chloroform, and becomes purplish-brown with sulphuric acid, and bright-red, changing to yellow, with nitric acid. Colton obtained also a trace of volatile oil, sugar, resins, a colorless and tasteless crystalline principle, and 12.4 per cent. of ash, of which 20 per cent. was soluble in water, the remainder in hydrochloric acid. Prof. Lloyd (1876) isolated from northern prickly ash a crystalline substance which is probably identical with the one previously mentioned; it is insoluble in water, soluble in boiling alcohol, is turned yellow by nitric acid, and dissolves with a deep-red color in sulphuric acid.

The fruit of X. piperitum was examined by Stenhouse (1854, 1857). On being distilled with water volatile oil is obtained, which on exposure to cold yields crystals of *xanthoxylin*, $C_{20}H_{24}O_8$. It melts at 80° C. (176° F.), has a slight odor and aromatic taste, and a neutral reaction. The liquid portion of the volatile oil is *xanthoxylene*, $C_{20}H_{16}$, is colorless, has a strong, agreeable odor, boils at 162° C. (324° F.), and yields with hydrochloric acid a liquid compound.

Action and Uses.—Xanthoxylum appears to be an arterial and nervous stimulant, which displays its virtues in producing diaphoresis, expelling *flatus*, and allaying muscular *rheumatic* pains. Locally it is an acrid irritant, and hence has been much used as a sialagogue. Its infusion may be applied on compresses or otherwise for producing revulsion. These qualities have caused it to be compared with mezereon, and, like it, to be used as a remedy for chronic constitutional *syphilis*. It has also been employed as an *emmenagogue*, like other acrid stimulants; and doubtless, like them, it will promote the *secretion of milk* when applied to the mammæ under appropriate circumstances. A decoction may be prepared by boiling Gm. 32 in Gm. 1500 (℥j in Oiij reduced to Oij). About a pint should be taken, in divided doses, within twenty-four hours. A saturated tincture may be used in the dose of Gm. 0.60 (gtt. x).

X. Naranjillo has attracted notice from its being sialagogue, sudorific, and diuretic, like jaborandi.

X. caribæum furnishes an alkaloid of which 5 Mgm. injected in watery solution beneath the skin of a frog produced rapid paralysis, followed by death in about half an hour, and similar effects were observed in rabbits and guinea-pigs (*Amer. Jour. Phar.*, lvi. 579).

XYLENUM.—Xylene.

Xylol, *Xyline*, Fr.; *Xylol*, G.

Formula $C_6H_4(CH_3)_2 = C_8H_{10}$. Molecular weight 105.76.

Origin and Preparation.—Xylene was discovered by Cahours (1850) in crude wood-spirit, and was subsequently found by Völckel (1853) in wood-tar (see Pix Liquida), and by Church (1855) in coal-tar. It is obtained from the oily liquid separating from diluted crude wood-spirit and from the light oil of wood-tar or coal-tar by treating these liquids first with sulphuric acid, and afterward subjecting them to fractional distillation, collecting only that portion which distils between 136° and 141° C. (277°–286° F.). It may also be prepared artificially from several benzene derivatives.

Properties.—Xylene is a thin, colorless, oily liquid, resembling benzene in odor, has a burning taste, and is insoluble in water, but dissolves readily in alcohol. It is *dimethylbenzene*, $C_6H_4(CH_3)_2$, and there are three modifications of it, two of which boil at 137° C. (278.6° F.), while orthoxylene boils at 141° C. (285.8° F.). The boiling-point of the isomeric *ethylbenzene*, $C_6H_5.C_2H_5$, is 134° C. (273.2° F.). Xylene unites with sulphuric acid to *xylene-sulphonic acid*, the barium salt of which crystallizes from hot water in transparent scales (Church). On treating xylene with cold concentrated nitric acid, *nitroxylene* is obtained as an oily liquid having a less agreeable odor than nitrobenzene. By oxidation xylene is converted into *toluic acid*, $C_8H_8O_2$, and *phthalic acid*, $C_8H_6O_4$.

Action and Uses.—The only purpose for which xylene appears to have been employed in medicine is to moderate the angina and eruption in the throat and to diminish the fetid exhalation from this part and from the skin in *small-pox*. Although given internally, it is said to coagulate and harden the contents of the pustules, and thereby lessen their tendency to ulceration and pitting. It seems to have been efficient, when applied to the throat in a gargle, spray, or wash, in lessening the swelling and difficulty of swallowing, and destroying the fetor when used upon the skin in a similar manner. It may also be given suspended in mucilage and syrup. The *dose* for an adult is stated to be Gm. 0.60–1 (gtt. x–xv), and for children Gm. 0.15–0.20 (gtt. iij–iv), but its topical application is to be preferred.

ZEA, *U. S.*—Zea; Corn-silk.

Stigmata maydis.—Filament de maïs, Fr.; *Maispistille*, G.

The styles and stigmas of Zea Mays. *Linné*. Bentley and Trimen, *Med. Plants*, 296. *Nat. Ord.*—Gramineæ.

Origin.—Indian corn or corn is a grass growing to the height of 1–6 M. (40 inches to 20 feet), with a solid stem from 1.3–8 Cm. (½ to 3 inches) in thickness. The stem terminates by the male inflorescence, while the female inflorescence is in the axil of the

leaves. The fruit is a caryopsis placed in eight or twenty-two lines on a thick cylindrical receptacle which is enclosed by bracts, which are similar to the leaves of the plant. The plant is very likely indigenous to tropical America, but was cultivated in America from before the Spaniards landed on these shores, so that at the present time the plant is not known in the wild state. Cultivation extends in America from 54° N. lat. to 40° S. lat., and in Europe to 52° N. lat. as long as the summer temperature amounts to 18° C. Around Lake Titicaca, in South America, 16° S. lat., Zea mays grows at an altitude of 3900 M. (12,795 feet) above the sea-level.

Description.—The caryopsis is roundish in shape, but by being placed closely on the receptacle is more or less compressed laterally, so that the sides are angular and the top only is rounded, and variable in size and color. The fruit consists of the embryo, placed at one side close to the funiculus, and albumen (endosperm) makes up the remainder of the fruit, which is covered by two seed-coats. On the side of the ripe caryopsis, just above the embryo, is noticed a slight protuberance which is the insertion of the style. This with the stigma is the official drug. It is filiform, about 15 Cm. (5.9 inches) long and 0.5 Mm. ($\frac{1}{50}$ inch) broad, yellowish or grayish in color, soft silky, finely hairy, and delicately veined longitudinally. It is without odor and has a sweetish taste.

Constituents.—Zea contains, according to Willan (1884), fixed oil, resin, tannin, sugar (in green but not in dried corn-silk), and on distillation with potassium hydroxide an alkaline liquid yielding crystals with acetic acid and precipitates with iodine and Mayer's reagent. Rademacher and Fischer (1886) isolated an acid which was called *maizenic acid* by them, decomposes alkaline carbonates, and forms crystallizable salts. The fixed oil is light-yellow in color, readily saponifies with potassium hydroxide, and solidifies at 10° C. (50° F.).

Ustilago (Uredo, *De Candolle*) Maydis, *Leveillé* (nat. ord. Fungi, Ustilagineæ). Cornsmut, Corn-ergot, *E.*; Ergot de maïs, *Fr.*; Maisbrand, Beulenbrand, *G.*; Rizon de maíz, *Sp.*—The numerous species of the genus Ustilago (smuts) grow upon living plants, the tissue of which is penetrated by the mycelium. The spores are produced in the hyphæ or their branches, which gradually form a gelatinous mass, and this is subsequently resorbed, so that finally the isolated spores remain behind. These are of a black or brown color, consist of a single cell, and have the outer membranes or exosporium either smooth or variously marked. Cornsmut forms irregular globose masses, which are somewhat lobed or obtusely branched, and sometimes 15 Cm. (6 inches) or more thick. The smooth or gelatinous membrane forming the covering of the fungus is diaphanous, and shows a blackish tint from the enclosed spores. Enclosed by this membrane is found a blackish-brown or brownish-black powder, consisting of innumerable spores, which are globular or oval, and when observed under the microscope have a nodular or spiny appearance, from the projections of the exosporium. Cornsmut has a peculiar rather heavy odor and an unpleasant taste. It should be preserved in a dry place, and should be kept on hand not longer than a year. C. H. Cressler (1881) showed the presence of a volatile base, which is probably identical with *trimethylamine*, and a sugar which crystallizes in needles, is very sweet, and does not reduce Trommer's test-solution; it is probably *mycose*; fixed oil, resin, and gummy matter were likewise obtained. Examined by J. H. Hahn (1881) and H. B. Parsons (1882), air-dry cornsmut yielded 9 to 10 per cent. of moisture, 2.5 to 4.2 per cent. of ether extract, and 4 to 5.5 per cent of ash. Alcohol takes up about 10 per cent., and water about 6.6 per cent., of soluble matter, from the latter of which Prof. Parsons obtained 5.5 per cent. of an acid compound which is probably identical with sclerotic acid, and is prepared by the same process (see p, 617).

Action and Uses.—Several cereals are subject to diseases which form products resembling ergot in their action. In 1870, Haselbach related that on several occasions cows had calved prematurely from having eaten maize affected with smut (Husemann, *Arch. f. Pathol. u. Pharmakol.*, ix. 276). In 1877, Estachy published the note of a case in which he successfully made use of smutted maize to revive suspended *labor-pains*. Afterward he employed it with advantage in the treatment of *hæmoptysis*, *seminal pollutions*, and *post-partum hæmorrhages* (*Bull. de Thérap.*, xciv. 85). From a series of experiments with it, Dr. James Mitchell (*Inaug. Thesis*, Univ. of Penna., 1883) concluded that it destroys consciousness, paralyzes first the sensory portion of the spinal cord, and, after depressing, paralyzes also the motor centres of the cord and motor nerves, and that probably the sensory nerves share in the general paralysis. Dr. Dorland states that the action of ustilago on the gravid uterus differs from that of ergot of rye, in producing clonic rather than tonic contraction of the organ during *labor*, and therefore in being safer than the latter agent. He has published several cases illustrating this statement (*Med. News*, li. 534). Others are due to Blair. The oxytocic virtues of the fluid extract have also been illustrated by Swiecicki (*Centralb. f. Med.*, vi. 628).

The *stigmata* of *maize*, or "corn silk," have for a long time had a popular reputation

in the south of France as a remedy for *strangury* and *calculous affections*, and they have also been held to possess anodyne virtues (*Bull. de Thér.*, xcvii. 377). In 1879, Dufau described this product as actively *diuretic* in cardiac and renal *dropsy*, and stated that the best effects followed its use in cases of *uric* and *phosphatic gravel*, *pyelitis*, *retention* and *incontinence of urine*, and *vesical catarrh* (*Med. Record*, xvi. 252). The diuretic action of the medicine in *cardiac dropsy* has been confirmed by Dupont (*Gaz. Méd. de Paris*, No. 9, 1884) and C. Paul (*Lancet*, Oct. 1885, p. 798). These statements have been confirmed and extended by various others, including Landrieux, who insists strongly on the diuretic action of the medicine (*Practitioner*, xxiv. 453; xxv. 379), Busey (*Med. Record*, xix. 319), Ducasse (*Amer. Jour. of Med. Sci.*, April, 1883, p. 565), and Stuver (*Med. News*, xliii. 372). It appears to be more suitable in chronic than in acute disorders of the urinary organs. According to Vauthier, maizenic acid is the active principle of the stigmata. It is recommended in *doses* of ⅛ grain. An extract of stigmata has been given in syrup to the extent of Gm. 1.30–2 (gr. xx–xxx) a day. The best preparation of maize silk appears to be the fresh infusion in the dose of a wine-glassful, and next to it the fluid extract in doses of Gm. 2–4 (f℥ss–℥ij).

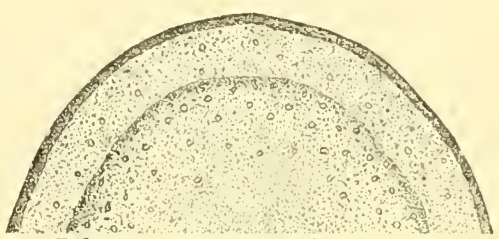
ZEDOARIA.—Zedoary.

Rhizoma (*Radix*) *zedoariæ*, P. A., P. G.—*Zédoaire longue*, Fr.; *Zittwerwurzel*, G.

The rhizome of Curcuma (Amomum, *Willdenow*) Zedoaria, *Roscoe*, s. Curcuma (Amomum, *Koenig*) Zerumbet, *Roxburgh*.

Nat. Ord.—Scitamineæ (Zingiberaceæ).

Fig. 315.



Zedoary: transverse section of one half of rhizome.

Origin.—The zedoary-plant is indigenous to India and some of the East Indian islands, has long dark-green leaves with a large purple spot in the centre, and produces a short scape bearing a raceme of yellow flowers. The tuberous ovate or pear-shaped rhizome is about 4 or 5 Cm. (1½–2 inches) long, and is usually cut into transverse sections before drying, sometimes in longitudinal slices.

Description.—Zedoary is met with in the market in the form of nearly circular disks, varying in diameter from 1 to 4 Cm. (½–1½ inches) and in thickness from 4 to 10 Mm. (⅙–⅔ inch). It is externally of a grayish-brown color, upon the transverse surface grayish, and has near the edge a dark-colored circular endoderm. The central portion contains a large number of small orange-colored resin-cells and irregularly scattered wood-bundles; both are seen also outside of the nucleus-sheaths, though in smaller number. The disk breaks with a short mealy or somewhat waxy fracture, has a peculiar aromatic odor, and a warm aromatic somewhat camphoraceous taste. The starch-granules are very similar to those of ginger.

Allied Drugs.—The French Codex recognizes also round zedoary, and refers the latter to Curcuma aromatica, *Roscoe*. The rhizome of this plant is internally yellow, and may furnish the bright-yellow disks which are occasionally seen among commercial zedoary. The rhizomes of several other species are likewise yellow.

Constituents.—Bucholz (1817) obtained from zedoary starch, mucilage, bitter extractive, a pungent soft resin, and volatile oil; the latter is pale-yellow, of a thick consistence, heavier than water, and has a bitterish, pungent, and somewhat camphoraceous taste.

Medical Action and Uses.—Zedoary is usually regarded as being almost identical in its qualities with ginger, but more agreeable, because less burning and acrid. It is used for similar purposes—viz. to promote *digestion*, expel *flatus*, etc. The powder may be prescribed in *doses* of from Gm. 0.60 to 2 (10–30 grains), or an infusion may be made with Gm. 12 or 16 (3–4 drachms) of the bruised root to Gm. 250 (½ pint) of wine or water, and given in tablespoonful doses.

ZINCI ACETAS, *U. S.*, *Br.*—Zinc Acetate.

Zincum aceticum, P. G.; *Acetas zincicus*, F. Cod.—*Acétate de zinc*, Fr.; *Zinkacetat*, *Essigsaures Zinkoxid*, G.; *Acetato de zinc*, Sp.

Formula $Zn(C_2H_3O_2)_2 2H_2O$. Molecular weight 218.74.

Preparation.—Digest for some time Commercial Zinc Oxide (or Carbonate) 2 parts in Acetic Acid and Distilled Water, each 5 parts; then heat to the boiling-point, filter

while hot, and set aside to crystallize. Drain the crystals in a funnel, and dry them upon bibulous paper. An additional quantity of crystals may be obtained by evaporating the mother-liquor to one-half, slightly acidulating with acetic acid, and crystallizing.—*Br.*

On digesting zinc oxide or carbonate with acetic acid, the zinc is dissolved, in the latter case with the evolution of carbon dioxide; $ZnO + 2HC_2H_3O_2$ yields $Zn(C_2H_3O_2)_2 + H_2O$. An excess of the zinc compound is used to avoid loss of acetic acid, and is removed by filtration. Should the acetic acid not have been diluted with too large a quantity of water, the hot filtrate, on cooling, will deposit most of the zinc acetate as crystals. The mother-liquor should be evaporated without boiling, so as to avoid loss of acetic acid and the formation of basic salt; acidulating the concentrated mother-liquor with a little acetic acid will restore the normal from the basic acetate, should the latter have been formed.

Properties.—Zinc acetate crystallizes in soft white pearly six-sided tablets or scales, which on exposure to the air lose their transparency from the evaporation of some acid and water of crystallization, and have a slight acid reaction, a slight acetous odor, and a sharp metallic taste. The salt melts readily in its water of crystallization, and on continuing the heat parts with the same, the loss amounting to 22.8 per cent., which is gradually reabsorbed in a moist atmosphere. On dry distillation acetic acid, carbon dioxide, acetone, and empyreumatic products pass over, a white pearly sublimate is formed, and zinc oxide, mixed with a little charcoal, remains behind; when strongly heated in the air upon a porcelain plate, the salt is decomposed, and burns with a greenish light and the production of a white smoke to zinc oxide. At ordinary temperatures the salt dissolves in 2.7 parts of water, and in a smaller quantity (1.5 *U. S.*, or 2 parts *P. G.*) at the boiling-point. It requires about 36 parts of cold alcohol and about 3 parts (*U. S.*) of boiling alcohol for solution. Treated with sulphuric acid, it is decomposed with the evolution of acetic acid. The aqueous solution of the salt acquires a dark-red color with ferric salts, the color being discharged on the addition of hydrochloric acid, and yields white precipitates with potassium ferrocyanide, hydrogen sulphide, ammonium sulphide, ammonia, and potassa, the precipitates with the last two reagents being soluble in an excess of the precipitant, and the colorless solution giving again a white precipitate with hydrogen sulphide.

Tests.—"The solution of the salt in 10 parts of water should give with an excess of hydrogen sulphide a purely white precipitate (absence of lead, copper, etc.), and the filtrate on being evaporated should leave no fixed residue (iron, earths, alkalies). On warming the salt with sulphuric acid it should not turn black (empyreumatic products and other organic matter). Its solution in 3 parts of water should be clear, and should remain clear on the further addition of water (absence of basic salt)."—*P. G.* The U. S. P. does not give any tests for organic impurities or basic salt, and directs testing for lead, arsenic, and copper in the acidulated aqueous solution by hydrogen sulphide, and for iron, aluminum, calcium, etc. by adding to the solution excess of ammonium carbonate, in which the hydroxides and carbonates named are insoluble. "On completely precipitating the zinc from this alkaline solution by ammonium sulphide, the filtrate should leave no fixed residue on evaporation and gentle ignition (salts of alkalies or of alkaline earths)."—*U. S.* If this precipitate, formed in the solution of the salt, has a white color, the test excludes all impurities except aluminum. "The dilute watery solution should not be affected by barium chloride or silver nitrate (sulphate and chloride)."—*U. S.*, *Br.*

Action and Uses.—Zinc acetate acts locally as an irritant and astringent. Internally, in large doses, it occasions vomiting. There is no reason to believe it poisonous in any dose. Internally, it is rarely used in this country. Some years ago it was recommended after this manner by certain German physicians in the treatment of erysipelas and other febrile affections attended with *delirium*, and occasionally it has been employed to check *diarrhœa* in typhoid fever and similar cases. Its chief use, however, is as a local substitutive and astringent application in *conjunctivitis*, *gonorrhœa*, and *leucorrhœa*. For the first-named affection a collyrium may be made with rose-water or mucilage of sassafras-pith in the proportion of about Gm. 0.06–0.12 (gr. j–ij) of the salt to the fluidounce, to which a few drops of wine of opium may be added. In gonorrhœa and leucorrhœa a customary injection is prepared by dissolving zinc sulphate and lead acetate, of each Gm. 0.80 (gr. xij) in Gm. 250 (f℥viij) of water. The salts react upon one another, producing zinc acetate and lead sulphate, the latter of which is precipitated. The value ascribed to this preparation appears to depend partly upon the modifying influence of the insoluble lead salt which sheathes the inflamed parts. When injected the

mixture should be shaken. A similar injection is prepared with zinc sulphate gr. vj; solution of lead subacetate ♏xxx; water ʒiv.

ZINCI BROMIDUM, *U. S.*—Zinc Bromide.

Zincum bromatum, *Bromuretum zincicum.*—*Bromure de zinc*, Fr.; *Zinkbromid*, G.; *Bromuro de zinc*, Sp.

Formula $ZnBr_2$. Molecular weight 224.62.

Preparation.—This salt is most conveniently prepared by digesting granulated zinc in hydrobromic acid, in which it dissolves with the evolution of hydrogen; the solution (filtered through asbestos or powdered glass) is carefully concentrated, acidulated with a little hydrobromic acid, and dried by the heat of a water-bath.

Properties.—Zinc bromide crystallizes with difficulty from its aqueous solution, and is therefore usually obtained in the form of a white granular powder. The salt is very deliquescent, has a slight acid reaction, is inodorous, and has a sweet and styptic metallic taste in diluted solution. It is freely soluble in water and in alcohol, and is also soluble in ether. Its aqueous solution yields with silver nitrate a white curdy precipitate, which is insoluble in dilute nitric acid and nearly insoluble in ammonia; it gives white precipitates with potassium ferrocyanide, ammonium sulphide, ammonia, and potassa, the precipitates with the last two reagents being soluble in an excess of the precipitant, and the colorless solution giving again a white precipitate with hydrogen sulphide. The salt melts on heating to 394° C. (741.2° F.), with partial decomposition, to a colorless or yellowish liquid which boils near 700° C. (1292° F.), and sublimes in white needles. If a few drops of copper sulphate test-solution be mixed with 5 Cc. of aqueous solution of zinc bromide, and then some sulphuric acid be carefully poured into the mixture so as to form a separate layer, a deep brownish-red color will appear at the line of contact, and will disappear on shaking the mixture.

Tests.—"If to the aqueous solution of the salt (1 in 20) a little starch test-solution be added, and then some chlorine-water drop by drop, the liquid should assume a pure yellow color, free from any shade of blue (absence of iodine). After acidulation with hydrochloric acid the aqueous solution should not be colored or rendered turbid by the addition of an equal volume of hydrogen sulphide test-solution (absence of arsenic, cadmium, lead, copper, etc.). On adding ammonium carbonate test-solution to the aqueous solution of zinc bromide, a white precipitate is produced, which should completely redissolve in an excess of the reagent (absence of iron, aluminum, calcium, etc.). If from this solution in ammonium carbonate test-solution all the zinc be precipitated by ammonium sulphide test-solution, the filtrate should leave no fixed residue on evaporation (absence of alkalies, magnesium, etc.). If 0.3 Gm. of the dry salt be dissolved in 10 Cc. of water, and 2 drops of potassium chromate test-solution be added, it should require 26.7 Cc. of decinormal silver nitrate test-solution to produce a permanent red color (corresponding to not less than 99.95 per cent. of the pure salt)."—*U. S.*

The aqueous solution of the salt should be clear (absence of basic salt), should not be precipitated by barium nitrate (sulphate), and if precipitated by silver nitrate and the mixture rendered alkaline by ammonia, the filtrate, on being acidulated with nitric acid, should merely produce a slight turbidity, but not a curdy precipitate (chloride).

Action and Uses.—It may be conjectured that in proposing zinc bromide as a medicine a vague idea was entertained of its uniting in itself the powers of two medicines, both of which are useful in spasmodic affections, and especially in chorea and epilepsy. That any dose of bromine which can be combined with a suitable dose of zinc should exert a sensible effect is quite improbable. We know of nothing that proves the clinical value of this salt, unless it be the statement that some years ago it was tested at the Salpétrière in Paris with satisfactory results in the treatment of *epilepsy*. The commencing *dose* of 1 grain daily was increased to 25 grains or more. Had its virtues been proven, it would probably have been heard of again, which has not been the case. Gowers (1880) says of it, "it seemed of small value, and is borne badly." Its *dose* may safely be that of the oxide of zinc—viz. Gm. 0.06 (gr. j) and upward.

ZINCI CARBONAS PRÆCIPITATUS, *U. S.*—Precipitated Zinc Carbonate.

Zinci carbonas, Br.; *Hydrocarbonas zincicus*, F. Cod.; *Zincum carbonicum.*—*Sous-carbonate*, *Hydrocarbonate de zinc*, Fr.; *Zinkcarbonat*, *Kohlensaures Zinkoxyd*, G.

Formula $2ZnCO_3.3Zn(OH)_2$. (?) Molecular weight 546.94. (?)

Preparation.—Take of Zinc Sulphate 10 ounces; Sodium Carbonate 10½ ounces; Boiling Distilled Water a sufficiency. Dissolve the sodium carbonate with a pint of the water in a capacious porcelain vessel, and pour into it the zinc sulphate, also dissolved in a pint of the water, stirring diligently. Boil for fifteen minutes after effervescence has ceased, and let the precipitate subside. Decant the supernatant liquor, pour on the precipitate 3 pints of boiling distilled water, agitating briskly; let the precipitate again subside, and repeat the processes of affusion of hot distilled water and subsidence till the washings are no longer precipitated by barium chloride. Collect the precipitate on calico, let it drain, and dry it with a gentle heat.—*Br.*

The French Codex has adopted a similar process, and directs adding 10 parts of zinc sulphate, dissolved in 50 parts of water, to a boiling solution of 11 parts of sodium carbonate in 50 parts of water, and drying the washed precipitate at 50° C. (122° F.).

On adding cold solutions of sodium carbonate and zinc sulphate together, neutral zinc carbonate is precipitated; $Na_2CO_3 + ZnSO_4$ yields $Na_2SO_4 + ZnCO_3$. The gelatinous precipitate rapidly undergoes decomposition, carbon dioxide being evolved; and this renders another portion of the precipitate soluble. But if the mixture is boiled, the carbon dioxide is expelled from the liquid and the whole of the zinc is precipitated. Adding the solution of zinc sulphate to that of sodium carbonate while boiling hot keeps the precipitate free from sodium compound, and the sodium sulphate which is formed at the same time is readily removed by washing with water. Potassium carbonate is not so well adapted for this process as the sodium salt, because the resulting potassium sulphate is less freely soluble in water; and ammonium carbonate is unsuitable, since a complete precipitation of the zinc cannot be effected.

Properties.—Zinc carbonate is a soft, impalpable, white, inodorous, and tasteless powder of somewhat variable chemical composition, permanent in the air, insoluble in water and other simple solvents, but dissolving readily in acetic and dilute mineral acids, with the evolution of carbon dioxide, and soluble also in aqueous solutions of ammonium salts. When heated in a crucible to redness it parts with its water and carbon dioxide, and leaves about 70 per cent. of oxide of zinc. Its solution in dilute sulphuric acid shows the chemical behavior described under Zinci Sulphas.

Composition.—According to H. Rose (1852), this is influenced by the temperature during the preparation and drying of the salt; it contains between 5 and 7 ZnO to 2 CO_2, but the proportion of water is more variable. The formula given above is that formerly recognized by the U. S. P., while $3ZnCO_3.5Zn(OH)_2.H_2O$ is given by the French Codex.

Tests.—The purity of zinc carbonate is ascertained by dissolving it in dilute sulphuric acid and testing in precisely the same manner as for zinc sulphate. The Pharmacopœia in addition directs the two following tests: No insoluble residue should be left if 0.5 Gm. of zinc carbonate be dissolved in 10 Cc. of diluted sulphuric acid (absence of lead). If 1 Gm. of the salt be placed in a flask with 10 Cc. of boiling water and 2 drops of phenolphtalein test-solution be added, not more than 1 Cc. of decinormal oxalic acid solution should be required to discharge the red color (limit of alkali).

Uses.—Zinc carbonate is seldom given internally, and its topical application is confined to those excoriated or inflamed surfaces which it is desirable to protect from the air and moderately to constringe. Hence in powder it is very useful for healing *blisters* and other superficial *sores* which resist milder applications, to prevent the friction that occasions *intertrigo* and to cure abrasions when they occur. It is most frequently applied in the form of ointment.

ZINCI CHLORIDUM, *U. S.*, *Br.*—Zinc Chloride.

Zincum chloratum, P. G.; *Chlorurétum zincicum* F. Cod.—*Chlorure de zinc*, Fr.; *Zinkchlorid*, *Chlorzink*, G.; *Cloruro de zinc*, Sp.

Formula $ZnCl_2$. Molecular weight 135.84.

Preparation.—The British Pharmacopœia repeats the directions given for preparing Liquor Zinci Chloridi (see p. 987), except that the last filtrate is to be evaporated in a porcelain basin until a portion of the liquid, withdrawn on the end of a glass rod and cooled, forms an opaque white solid; the liquid is then poured into proper moulds, and when the salt has solidified, but before it has cooled, it is placed in closely-stoppered bottles.

The reactions occurring in the preparation and purification of zinc chloride are explained on page 987. Since zinc chloride destroys vegetable fibre and transforms cellulose and

starch into soluble modifications, its solution should not be filtered through paper, but through asbestos or powdered glass; otherwise the fused salt will be black. Toward the close of the evaporation of the solution the heat should be regulated so as not to decompose the salt, and in case the fused mass should become opaque from the separation of basic salt a little hydrochloric acid should be added. If the salt is desired for solution in water, the liquid is evaporated and continually stirred until a granular powder remains, a few drops of hydrochloric acid being added toward the close of the process.

Properties.—Zinc chloride is either in the form of a white crystalline powder or in opaque tablets or rods. It is inodorous, has a strongly caustic and metallic taste, is very deliquescent on exposure, has an acid reaction, and when heated to a little over 100° C. (115° C. = 239° F., *U. S.*) it melts to a colorless liquid which congeals to a white mass; at a higher heat it is partly volatilized, forming white fumes and leaves a yellowish residue; but when heated in a current of chlorine gas the salt sublimes in acicular crystals. Zinc chloride is freely soluble in water (0.3 part, *U. S.*), but usually yields with water an opalescent solution from the presence of a little oxychloride, which is readily dissolved by a few drops of hydrochloric acid; the solution dissolves starch, paper, and other organic compounds. Zinc chloride dissolves also freely in alcohol, and somewhat less freely in ether. In contact with sulphuric acid it is converted into zinc sulphate. Its solutions yield white precipitates with ammonium sulphide, ammonia, and with silver nitrate, the last two being readily soluble in an excess of ammonia. On mixing a concentrated solution of zinc chloride with zinc oxide a plastic mass of zinc oxychloride is obtained, which soon hardens.

Tests.—The pharmacopœial requirements for the purity of zinc chloride are as follows: "The aqueous solution (1 in 20) should be clear, or at most only very slightly opalescent, and, if it be mixed with an equal volume of alcohol, a single drop of hydrochloric acid should suffice to render 10 Cc. of the mixture perfectly clear (limit of oxychloride). If to the aqueous solution, acidulated with hydrochloric acid, an equal volume of hydrogen sulphide test-solution be added, it should not become colored or turbid (absence of arsenic, cadmium, lead, copper, etc.). If ammonium carbonate test-solution be added to the solution, the precipitate should be of a pure white color, and completely redissolve in an excess of the reagent (absence of iron, aluminum, calcium, etc.). If from this solution in ammonium carbonate test-solution the zinc be completely precipitated by ammonium sulphide test-solution, the filtrate should leave no fixed residue on evaporation (absence of alkalies, magnesium, etc.). The aqueous solution should not be rendered turbid by the addition of barium chloride test-solution (absence of sulphate). If 0.3 Gm. of dry zinc chloride be dissolved in 10 Cc. of water, and 2 drops of potassium chromate test-solution be added, it should require 44.1 Cc. of decinormal silver nitrate solution to produce a permanent red color (corresponding to not less than 99.84 per cent. of the pure salt)."—*U. S.* The P. G. requires the salt to form a clear and colorless solution with an equal weight of water; on the addition of 3 parts of alcohol a flocculent precipitate may form which should dissolve on adding 1 drop of hydrochloric acid.

Pharmaceutical Uses.—Causticum cum chlorureto zincico, *F. Cod.*—Chloride-of-zinc pencils, *E.;* Pâte de Canquoin, *Fr.*—Dissolve zinc chloride 32 Gm. in cold distilled water 4 Gm.; add zinc oxide 8 Gm., previously mixed with well-dried wheat flour 24 Gm.; triturate so as to obtain a paste, and form this into cylinders or other shaped pieces, which are to be completely dried in an air-bath at a temperature gradually raised from 50° to 100° C. (122°–212° F.).

Action and Uses.—Applied externally, zinc chloride is powerfully corrosive, and, although very painful, is perhaps less so than corrosive sublimate or arsenic. Its first application produces a sense of warmth and more or less redness. Upon the denuded skin its action is more rapid as well as more painful, but it does not extend beyond the limits of the caustic. If it is made to penetrate deeply, it coagulates the blood in the vessels and converts the soft tissues into a tough, dry, and uniform mass which is not fetid, and which separates in from one to two weeks, leaving behind a clean granulating surface that tends to rapid cicatrization. The case is reported by Dr. Nichols of a man who had applied to an epithelioma of the lip, first, a strong potash lotion, and then a paste composed as follows: Zinc chloride ʒj, starch ʒiij, podophyllin ʒss. It caused extreme pain in the part, followed by gastric pain, and then by unconsciousness, stertor, dilated and fixed pupils, a small, weak pulse at 110, flushed face, cold perspiration, convulsions, coma, and death in about eight hours. No internal lesions were found to explain the cause of death (*Boston Med. and Surg. Jour.*, Oct. 1886, p. 343).

The rare occasions in which zinc chloride may be given internally have been already pointed out. (See LIQUOR ZINCI CHLORIDI.) In the same connection its uses as a disinfectant were noticed. When, owing to the timidity of patients or any other cause, the knife cannot be employed for the removal of *malignant* and other *morbid growths*, this preparation is preferred before other caustic applications, because it runs no risk of poisoning the system, and because its action is limited to the points of its contact with the tissues. It was originally alleged to be much more successful than excision in the treatment of cancer, and, indeed, to have cured four-fifths of the cases in which it was employed; it was also thought to possess the advantage of acting on the diseased rather than on the healthy tissues. These conclusions have been proved groundless, as well as the allegation that the pain produced by the application is inconsiderable. On the contrary, the pain caused by zinc chloride far exceeds that occasioned by the knife, even without the use of anæsthetics, and is of much longer duration. To what degree this caustic is capable of preventing a return of cancerous disease is still undetermined. It is very positively alleged by competent authorities that the recurrence of cancerous tumors is due mainly to their incomplete extirpation by excision, and that this and some other caustics reach and destroy the cancerous germs more effectually than a surgical operation.

The mode of action here attributed to zinc chloride was long since pointed out by Bonnet. He remarked that when applied as a paste in the neighborhood of large blood-vessels, arteries, or veins, its caustic action does not occasion hæmorrhage, but under its influence they contract and shrivel, and only remain as thin, hard, and apparently solid strings. The experiments of Gersuny and Gjorgjević on dogs and rabbits exhibited a similar result, for even when the chloride was applied to wounds in which large veins were exposed the vessels were not penetrated, there was no hæmorrhage, and their walls collapsed and shrivelled. In 1878, Dr. Carl Langenbuch treated a case of *rodent ulcer*, or of *lupus exedens*, affecting the face and neck and laying bare the large blood-vessels of the cervical region—a case in which instrumental interference was out of the question—by means of zinc chloride, with the result of arresting the ulceration, suspending the circulation through the exposed vessels, and securing a perfect cure. He also refers to a similar treatment of gangrenous ulcers in the Franco-German War of 1870–71. In these cases the pure chloride was applied in the manner described below as Cooke's. It appears, therefore, that the action of this compound is not properly a caustic action; it mummifies the tissues, but does not destroy them. Of late years zinc chloride has been used in the treatment of *cancer* and other affections of the cavity of the *uterus*. Fraenkel, after curetting the diseased surface and applying Paquelin's cautery, made use of injections of the chloride (2 : 3). Superficial sloughing and a cure followed (*Therap. Monatsh.*, iii. 34). Later on he denied that this method tended to cause adhesions between the opposite walls of the uterine cavity, provided that dilating bougies were duly employed. Czerny used 4 parts of the chloride and 1 part of the zinc oxide with 3 parts of flour enclosed in gauze and secured with a string, forming a tampon applied after the use of the curette and the cessation of hæmorrhage. It was allowed to remain in place about six hours, or less if there seemed to be any risk to the rectal or vesical septum. On its removal it was replaced by iodoform gauze (*Am. Jour. Med. Sci.*, Oct. 1888, p. 432). A similar plan was employed by Dumontpallier (*Archives gén.*, Juill. 1889, pp. 111, 369). This compound has been used for the cure of uterine and vaginal *leucorrhœa* and *gonorrhœa* and *hæmorrhagic endometritis* (*Med. News*, liii. 530; *Therap. Monatsh.*, iii. 35). Landerer has reported the successful treatment of small *cystic tumors* (ganglion, ranula, hygroma) by injecting them with a 1 per cent. solution of zinc chloride (*Centralb. f. Ther.*, vii. 738). In 1879 cases of *nasal polypi* were cured by injecting the tumors with zinc chloride, and in the following year several others were reported (*Archives gén. de Med.*, Mars, 1880, p. 353; *Med. Record*, xviii. 433). In 1881 additional cases were furnished by Dr. Reynolds of Kentucky (*Trans. Amer. Med. Assoc.*, xxxii. 237). The stronger preparations have been used to destroy anastomotic *aneurisms* and to open *abscesses* where puncture or incision might be dangerous, as abscesses of the liver. Zinc chloride has been applied to destroy the hardened tissues surrounding cavities and fistulæ following the suppuration of *scrofulous glands*, and is said to possess the advantage over other methods of local treatment of not leaving behind it irregular or unsightly scars. It has also been employed to fill the cavities of *carious teeth*, especially of the incisors.

Several modes of applying zinc chloride as a caustic have been employed. The oldest is that of Canquoin, who made use of a paste containing 1 part by weight of the

chloride to 2, 3, 4, or 5 parts of rye flour; or 5 parts of the chloride and 10 of rye flour made into a paste with 2 parts of glycerin may be used. Gluten has been used as an excipient instead of flour. Mayet's paste is made as follows: Zinc chloride 8 parts; zinc oxide 1 part; wheaten flour, dried at 212° F., 7 parts; water 1 part. Mix the zinc oxide and the flour, dissolve the zinc chloride in the water, and add to the solution the mixture of zinc oxide and flour. Rub the paste in a mortar for ten minutes. Cooke's method consists in saturating lint with the deliquesced salt, and keeping it, after it is dried, in a close box of wood or pasteboard. The lint when used must be cut with scissors that can be spared, since it ruins steel instruments. A convenience of this preparation is that it can be applied in pieces proportioned to the size of the part to be acted upon. A similar advantage is possessed by a mixture of zinc chloride and gutta-percha in equal parts; its caustic action is attenuated by the inert and insoluble portion of it. Conical or arrow-shaped bodies made with zinc chloride alone, or of this salt and potassium nitrate, are sometimes thrust into incisions made in the tumor to be acted upon. Before applying any of these mixtures the cuticle, if unbroken, must be removed by means of strong ammonia.

ZINCI IODIDUM, *U. S.*—Zinc Iodide.

Ioduretum zincicum.—Iodure de zinc, Fr.; *Zinkjodid*, G.; *Ioduro de zinc*, Sp.

Formula ZnI_2. Molecular weight 318.16.

Preparation.—This salt may be prepared by dissolving zinc oxide or carbonate in hydriodic acid, or, according to Doepp (1839), by digesting in a flask 3 parts of granulated zinc, 10 parts of iodine, and 20 parts of water until the liquid has become colorless, when it is filtered through asbestos or powdered glass, and rapidly evaporated to dryness at a moderate heat. The yield is 12½ parts. The salt should be at once put into vials, which are to be kept carefully stoppered.

Properties.—Zinc iodide resembles zinc chloride and bromide, is a white granular, crystalline, inodorous powder, and has a caustic and metallic or in diluted solution a sweetish and styptic taste and an acid reaction. On exposure it is very deliquescent, and gradually becomes colored by, and acquires the odor of, free iodine. It is freely soluble in water and alcohol, and the solution on being largely diluted with water separates a gelatinous precipitate of zinc hydroxide (Rammelsberg). It readily forms basic compounds, an oxyiodide, soluble in warm and insoluble in cold water, being produced by the prolonged digestion of iodine and zinc with water. The iodide melts when carefully heated to 446° C. (834.8° F.) to a colorless liquid, and may be sublimed in quadrangular needles, but on being heated in the air is decomposed into iodine and zinc oxide. The aqueous solution gives white precipitates with ammonium sulphide, potassium ferrocyanide, ammonia, and potassa, the last two being soluble in an excess of the precipitants, and it yields a scarlet-red precipitate with mercuric chloride, a bright-yellow one with lead acetate, and a pale-yellow one with silver nitrate, the latter being insoluble in ammonia and in nitric acid. The salt, warmed with strong sulphuric acid, liberates iodine and sulphur dioxide, zinc sulphate being formed at the same time.

Tests.—The absence of foreign metals is ascertained in precisely the same manner as in zinc chloride and bromide, and the absence of sulphate by the solution not producing a precipitate with barium chloride. The absence of other zinc salts may be ascertained as follows: 1 Gm. of the dry salt, when completely precipitated with silver nitrate, yields 1.472 + Gm. of dry silver iodide. Bromide and chloride, if present, increase the weight of the silver precipitate. The Pharmacopœia admits a salt containing 98.62 per cent. of pure zinc iodide, as seen from the following test: If 0.5 Gm. of dry zinc iodide be dissolved in 10 Cc. of water, and 2 drops of potassium chromate test-solution be added, not more than 31.4 Cc. nor less than 31.0 Cc. of decinormal silver nitrate solution should be required to produce a permanent red color (31.4 Cc. corresponding to 100 (99.9) per cent., and 31.0 Cc. to 98.62 per cent. of pure zinc iodide). This seems to be almost too strict a requirement, in view of the alterations taking place on exposure. Hager suggests the following test, which requires at least 95 per cent. of pure ZnI_2: 0.5 Gm. of the dry salt should yield with 5 Gm. of alcohol a nearly clear solution free from crystalline deposit; add to this liquid 0.6 Gm. of silver nitrate dissolved in 30 Gm. of water, afterward 5 Gm. of ammonia-water, agitate well, and filter; the precipitate when dried should weigh not less than 0.7 Gm., and the filtrate on being acidulated with nitric acid should remain clear or at most become faintly opalescent, but should not produce a curdy precipitate.

Pharmaceutical Preparation.—Syrupus zinci iodidi, Syrup of zinc iodide. Digest 2 troyounces of iodine and 5 drachms of granulated zinc in 8 ounces of water, and when the color of iodine has disappeared pass the liquid through a small filter into a bottle containing 15 troyounces of sugar; wash the filter with a little water and dissolve the sugar by agitation. The syrup should measure 20 fluidounces, and is of about the same iodine strength as the syrup of iodide of iron (A. B. Taylor, 1852). This is the most convenient form for the administration of zinc iodide.

Uses.—As long ago as 1853 this compound was recommended in hysterical chorea (*Lancet*, Dec. 1853, p. 264), and later in various scrofulous affections of the skin and eyes (Guibert, *Nouveaux Médicaments*, 1864). It resembles zinc chloride as a caustic. It was used by Lente as an application to the Eustachian tube in certain cases of deafness (*Amer. Jour. Med. Sci.*, Oct. 1859, p. 390), and by Ross as an application to enlarged and indurated *tonsils*. A solution of Gm. 0.06–0.12 in Gm. 30 (gr. i–ij in f℥j) of water has been employed as an injection in *gonorrhœa* and *leucorrhœa*. It seemed to be entirely obsolete when it was revived in the Pharmacopœia of 1880. Its *dose* is said to be Gm. 0.03–0.12 (gr. ss–ij).

ZINCI OXIDUM, *U. S., Br.*—Zinc Oxide.

Zincum oxydatum, P. G.; *Oxydum zincicum*, F. Cod.; *Flores zinci.—Oxyde de zinc*, Fr.; *Zinkoxyd*, G.; *Oxido de zinc*, Sp.

Formula ZnO. Molecular weight 81.06.

Preparation.—Place zinc carbonate in a loosely-covered Hessian crucible, and expose it to a dull red heat until a portion, taken from the centre of the contents of the crucible and cooled, no longer effervesces when dropped into diluted sulphuric acid. Let the crucible cool, and transfer the product to stoppered bottles.—*Br.*

Nearly identical is the process of the French Codex for *oxyde de zinc par voie humide*. When heated, zinc carbonate parts with its water and carbon dioxide, leaving zinc oxide behind. The operation is known to be finished when a small portion, taken from the centre of the vessel and mixed with a little water, no longer produces effervescence on being dropped into dilute sulphuric acid. A dull red heat, as directed by both pharmacopœias, is not necessary for this purpose. Mohr observed that a temperature of 280° C. (536° F.) is sufficient for obtaining the oxide, and, according to Hager, all carbon dioxide is expelled at 250° C. (482° F.). With quantities of from 6 to 12 ounces of zinc carbonate the operation is conveniently performed in a glass flask placed in a sand-bath and heated by means of gas or on a stove. The capacity of the flask should be about double the volume of the powdered carbonate. If the zinc carbonate is not previously powdered, a higher heat and a longer time are required for expelling all the carbon dioxide. If the carbon dioxide be driven off below a red heat, or if the heating to dull redness has not been prolonged unnecessarily, the cold zinc oxide has a white color, but after having been exposed to a full red heat it will retain after cooling a more or less decided yellow tint.

The French Codex recognizes also an *oxyde de zinc par voie sèche*, which is made by melting pure zinc in an inclined crucible in contact with air to a bright red heat, when it takes fire and burns to oxide, which condenses in the upper part of the crucible or in suitable vessels suspended over it, and after cooling is passed through a fine sieve. The same product, though less pure, was recognized by the U. S. P. 1870 as Zinci oxidum venale (zinc-white); Zincum oxydatum crudum, *P. G.*; Flores zinci, Pompholix, Nihil album, Lana philosophica. This was recommended by Courtois (1780) as a pigment in in place of white lead, but began to be used as such about 1844, after Leclair had elaborated a process for making it at a sufficiently low rate. At present it is usually prepared directly from zinc ores by processes identical with or similar to those recommended by W. J. Taylor (1861) and G. Darlington (1862). A mixture of zinc ore and coal is packed in a suitable furnace upon a layer of coke, previously ignited, and heated by means of a blast, and the vapors of zinc oxide, which are at first more or less mixed with particles of charcoal, are conducted into a chamber, where they condense as a gray powder. As soon as the condensing product has a white color the vapors are passed into another chamber, where they condense as zinc-white. The gray product is identical with the impure oxide of zinc, which was formerly used in medicine under the names of *tutia*, *cadmia fornacum*, or *tutty*.

Properties.—Zinc oxide is a soft, inodorous and tasteless, pale-yellowish, nearly white powder, which on being heated acquires a deep lemon-yellow color, and on cooling

becomes again nearly white. After having been heated to bright redness it continues for some time to emit light in the dark. It dissolves in dilute acetic and other acids without effervescence, is completely insoluble in simple solvents and in saccharine liquids, and is without action on test-paper. According to Daubrée, it may be obtained crystallized by heating zinc chloride in a current of steam. On exposure to the atmosphere it slowly absorbs water and gradually also carbon dioxide.

Tests.—Zinc oxide may contain traces of chloride or sulphate, which are detected in the solution in dilute nitric acid by silver nitrate and barium nitrate. The liquid obtained on boiling zinc oxide with water and filtering should not have an alkaline reaction from the presence of sodium carbonate. The solution of the oxide in hydrochloric acid should not assume a red color on the addition of potassium sulphocyanate (iron), should not be colored or precipitated by hydrogen sulphide (lead and similar metals), and should be completely precipitated with a white color by ammonium sulphide; the filtrate from this precipitate, after having been boiled, should not be disturbed on the addition of ammonium oxalate (calcium) or of ammonium phosphate (magnesium). The U. S. P. does not give any tests for acidulous radicals, and directs testing for foreign bases after dissolving the oxide in diluted sulphuric acid in the same manner as directed for zinc sulphate, but requires that if 10 Cc. of diluted sulphuric acid be added to 0.5 Gm. of zinc oxide, no effervescence should occur (absence of carbonate), and a perfectly clear solution should result (absence of lead, silicate, etc). Zinc-white should respond to the same tests, but a minute proportion of lead is permitted by the P. G. by the following test, which fails to detect about ½ per cent. of PbO: Dissolve 0.2 Gm. of the zinc oxide in 2 Gm. of acetic acid; after cooling, the solution should not be affected (become yellow and turbid) on the addition of potassium iodide.

Action and Uses.—In experiments upon healthy men repeated doses of 4 grains or more of zinc oxide occasioned nausea, eructation, vomiting, confusion of the mind and senses, heat in the epigastrium, thirst, fever, a jerking pulse, muscular spasm, etc. Sometimes, when prescribed in very large and continued doses, it has produced marasmus, œdema of the feet, diarrhœa, etc. That these effects were really due to the poisonous action of zinc is proved by the manner in which smelters of the metal are affected—viz. with cough, dyspnœa, and even hæmoptysis or dyspeptic symptoms, vomiting and diarrhœa, loss of flesh, neuralgia, muscular spasm, and debility. Besides these symptoms are observed a gradual anæsthesia of the skin, diminished reflex excitability, muscular tremors, especially of the legs; in a word, the signs of disorder of the spinal marrow (Schlochow, *Monthly Abstract*, Mar. 1880, p. 158).

Zinc oxide has been used in medicine chiefly for the cure of nervous diseases, and long before the experiments above referred to denoted its special mode of action; for it was introduced by Paracelsus, and proposed as a remedy for epilepsy by Gaubius, who learned its virtues from a charlatan. Many physicians have claimed for it a curative virtue in *epilepsy*, and among them some whose names have the weight of authority; nevertheless, a rigid scrutiny of facts has proved that it never cures, and seldom even palliates, the disease. In six out of twenty cases under the care of Russell a decided impression was made on the course of the disease by the zinc given to the extent of 18 grains three times a day (*Practitioner*, xxx. 83). The utility of zinc oxide is still less in *chorea*, a disease which as naturally tends to cure as epilepsy is rebellious to all treatment that is not merely palliative. The utility of the medicine in these affections is claimed by some physicians who have used it along with the bromides! Such a confusion of ideas is a fruitful source of error in therapeutics. Zinc oxide has also been used with alleged benefit in *hysteria* and *spasmodic asthma*. In the nervous state consequent upon *delirium tremens*, and in *chronic alcoholism* attended with want of sleep, trembling, vertigo, tinnitus aurium, muscæ volitantes, and occasional hallucinations, it sometimes is very beneficial. In such cases it may be given in doses of Gm. 0.12 (2 grains) three times a day, and gradually increased. There is little doubt that this medicine is one of the best for colliquative *sweats*, although it sometimes fails, and is not superior to zinc sulphate. It should be prescribed in Gm. 0.06 (gr. j) doses every hour for three or four hours in the evening. Murrell recommends that it be given "at bedtime in from 5- to 10-grain doses, made up into pill with extract of henbane or conium" (*Practitioner*, xxiii. 91). Such doses appear to us fitted, if continued, to produce vomiting and even poisonous effects. In *diarrhœa* and *dysentery* it was recommended by J. Waring-Curran (1868) as being their best and most speedy cure. Some time later it was advised by Gubler in diarrhœa, and in imitation of him by Bonamy (1876), who employed it successfully when other remedies had failed in an epidemic of dysenteric

diarrhœa. He mixed Gm. 3.30 (gr. l) of zinc oxide with Gm. 3.50 and Gm. 0.66 (10 grains) of sodium bicarbonate, and divided the mixture into three or four parts, which were administered during the day at intervals of three hours. The effect of the medicine is said to have been prompt and decisive even in the most chronic cases. This conclusion was subsequently confirmed in Scotland by Brakenridge and by Renton (1877), and by Jacquier in France (1878). In infantile diarrhœa the medicine was given to a child of six months in doses of Gm. 0.12 (2 grains) every two hours. It was used with advantage by James L. Tyson, although sugar was mixed with it, which Renton found to impair its efficiency. Associated with belladonna, it is more efficient than is either medicine alone. Zinc oxide with valerian in large and increasing doses is said to have cured *diabetes insipidus* (*Amer. Jour. Med. Sci.*, Jan. 1882, p. 276). In fine powder it forms an admirable application for promoting the healing of *intertrigo*, superficial *burns* and *scalds*, *fissures* of the *nipples* or *anus*, *balano-posthitis*, *chancroids*, flabby *ulcers*, *leucorrhœa*, and moist *eruptions of the skin*. For some of these purposes it may be mixed with powdered starch, acacia, or lycopodium. The official ointment is used for similar purposes. The sore or surface should be washed with a carbolic-acid solution before the powder or paste of zinc is applied. A paste made with linseed oil has been used in *erysipelas* instead of the more usual white-lead paint. The following preparation has also been recommended: Glycerin 16 parts, starch 8 parts, zinc oxide 4 parts. Warm the glycerin and starch in a porcelain capsule until they form a jelly, and then stir in the zinc oxide.

Zinc oxide may be administered in powder or in pill, and in *doses* of Gm. 0.06–0.30 (gr. j–v). It is best given after meals.

Zinc oleate made into an ointment with 1 part of vaseline or olive oil, or 2 parts of lard or simple ointment—vaseline being preferable, as not liable to change—has been used with excellent results in the treatment of *eczema*, especially during the stage of active secretion (Crocker, 1879). Haslam has recommended a mixture of this oleate with iodoform as an application to *uterine ulcers*, etc.

Commercial zinc oxide may be used in powder as an external application in the various local affections mentioned above, to diminish secretion and protect parts from the action of the air.

ZINCI PHOSPHIDUM, *U. S.*—Zinc Phosphide.

Phosphoretum zincicum, F. Cod.—*Phosphuret of zinc*, E.; *Phosphure de zinc*, Fr.; *Phosphorzink*, G.; *Fosfuro de zinc*, Sp.

Formula Zn_3P_2. Molecular weight 257.22.

Preparation.—If zinc is fused in a crucible, and phosphorus is added in small pieces at a time, the crucible being kept covered as much as possible, a union of the two elements takes place, but it is difficult to obtain the compound of uniform composition. According to Schrötter (1849), finely-divided zinc is heated to dull redness while the vapor of phosphorus is being passed over it. Vigier's modification of this process consists in heating the zinc in a current of hydrogen; after all atmospheric air has been expelled vapors of phosphorus are passed over the zinc. On account of the great danger connected with this process, owing to the liability to violent explosions, Proust (1869) proposed the following process: Nitrogen gas is evolved by heating ammonium nitrite, and the gas is passed through a bottle in which hydrogen phosphide is prepared by introducing calcium phosphide through a wide tube into diluted hydrochloric acid contained in the bottle. The mixed gases are passed through a wash-bottle into a porcelain tube in which zinc is heated to redness, when the metal will combine with the phosphorus and the liberated hydrogen will escape together with the nitrogen. If the apparatus is filled with nitrogen gas before the hydrogen phosphide is generated, there is no danger of an explosion.

Properties.—Zinc phosphide is stated to be permanent in the air, but the slight phosphorus odor emitted by it indicates its gradual oxidation; it should therefore be preserved in well-stoppered vials. It forms a gray crystalline or friable mass, having upon the fractured surface a bright metallic lustre. Vigier (1875) recommends it to be powdered and freed by sifting from metallic zinc which may be present; in this state it resembles iron reduced by hydrogen, has a blackish-gray color and a slight taste of phosphorus, is readily soluble in dilute sulphuric or hydrochloric acid, with the copious evolution of hydrogen phosphide, and by concentrated nitric acid is converted into zinc phosphate. It melts at a higher temperature than zinc, and volatilizes unchanged, con-

densing in needles if the air be excluded; but when heated in contact with air it is oxidized to zinc phosphate.

Composition.—Pure zinc phosphide consists of 24.12 per cent. of phosphorus and 75.88 per cent. of zinc.

Tests.—"1.171 Gm. of zinc phosphide in contact with official hydrochloric acid should evolve 200 Cc. of hydrogen phosphide, which should be completely absorbed by a concentrated solution of copper sulphate."—*F. Cod.* This test proves the absence of metallic zinc, which would evolve hydrogen; hydrogen phosphide produces in the copper solution a black precipitate of copper phosphide. The U. S. P. directs testing only for foreign metals after dissolving the compound in diluted hydrochloric acid, and demands the absence of insoluble impurities by directing that 0.5 Gm. of zinc phosphide shall form a clear solution with 15 Cc. of diluted hydrochloric acid, heat being applied to expel all of the hydrogen phosphide.

Action and Uses.—Zinc phosphide has been used principally in nervous disorders attributed to defective nutrition of the brain and spinal marrow. Among these *locomotor ataxia* and *general paralysis* are especially to be mentioned. It is alleged that in certain cases of the former affection co-ordination of the movements has been restored and the evidences of sexual power revived; but the paucity of reports of its success in a disease which is ordinarily rebellious to all medicinal treatment would argue badly in its favor, even if its total want of curative power in other cases of the same disease were not well established. An almost identical statement may be made respecting the other affection mentioned, for only one or two cases of paralysis, ascribed to disseminated sclerosis of the cord, and an equal number of cases of *mercurial* tremor, are recorded in which any advantage appears to have been derived from the medicine. A very similar summary may be given of its effects in *anaphrodisia*. Several persons have published accounts of its curative virtues in *neuralgia*, *spinal irritation*, *hysteria*, and *cerebral disorders*, with an excessive elimination of phosphates with the urine, in *chlorosis*, *anæmia*, *amenorrhœa*, *dysmenorrhœa*, and *metrorrhagia*. But these reports, dating as far back as 1868, have not been sufficiently confirmed. Mercier (1878), indeed, found the medicine useful in neuralgia, capable of retarding the progress of locomotor ataxia, almost certain in relieving anaphrodisia, and efficient in dysmenorrhœa and amenorrhœa. But his results do not accord with general experience. It was claimed (1874) to be an efficient remedy for the neuralgic pains of *herpes zoster*, but the claim has not been confirmed.

Zinc phosphide may be given in the dose of Gm. 0.004–0.008 (gr. $\frac{1}{16}$ to $\frac{1}{8}$), which is estimated to equal $\frac{1}{65}$ to $\frac{1}{32}$ gr. of phosphorus, but some of those who have most recommended it direct doses of Gm. 0.02 (gr. $\frac{1}{3}$) every two hours. It may be prescribed in pills with liquorice powder and syrup or in powder with starch. It is best given when the stomach does not contain food, for it is then less apt to disengage hydrogen phosphide.

Dr. R. W. Gardner objected to zinc phosphide that, as no oxygen enters into its composition, it must produce in the stomach the same irritant effects as uncombined phosphorus. He therefore proposed in its stead *zinc hypophosphite*, as not irritant and as admitting the use of such doses as fully to meet all indications for either phosphorus or zinc. The salt is perfectly soluble, and therefore readily absorbable. Its administration is recommended in a syrup containing 8 grains of the salt to a fluidounce, of which a teaspoonful is suggested as an average dose.

ZINCI SULPHAS, *U. S.*, *Br.*—Zinc Sulphate.

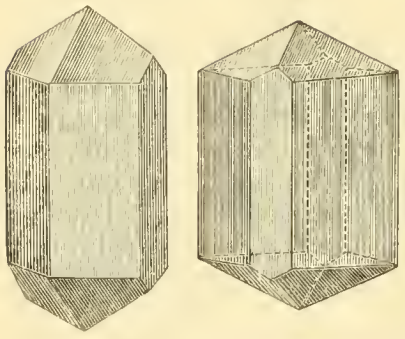
Zincum sulfuricum, P. G.; *Sulfas zincicus*, F. Cod.; *Vitriolum album.*—*White vitriol*, E.; *Sulfate de zinc*, *Vitriol blanc*, *Couperose blanche*, Fr.; *Zinksulfat*, *Schwefelsaures Zinkoxyd*, *Weisser Vitriol*, *Galitzenstein*, G.; *Sulfato de zinc*, Sp.

Formula $ZnSO_4.7H_2O$. Molecular weight 286.64.

Preparation.—Take of Granulated Zinc 16 ounces; Sulphuric Acid 12 fluidounces; Distilled Water 4 pints; Solution of Chlorine a sufficiency; Zinc Carbonate $\frac{1}{2}$ ounce or a sufficiency. Pour the sulphuric acid, previously mixed with the water, on the zinc contained in a porcelain basin, and when effervescence has nearly ceased aid the action by a gentle heat. Filter the fluid into a gallon bottle, and add gradually, with constant agitation, a solution of chlorine, until the fluid acquires a permanent odor of chlorine. Add now, with continued agitation, the zinc carbonate until a brown precipitate appears; let it settle, filter the solution, evaporate till a pellicle forms on the surface, and set aside

to crystallize. Dry the crystals by exposure to the air on filtering-paper placed on porous tiles. More crystals may be obtained by again evaporating the mother-liquor.—*Br.*

Fig. 316.



Crystals of Zinc Sulphate.

Zinc dissolves in dilute sulphuric acid with the evolution of hydrogen, forming zinc sulphate: $Zn_2 + 2H_2SO_4$ yields $2ZnSO_4 + 2H_2$. Arsenic, copper, and lead, which are sometimes present in commercial zinc, are removed by the continued digestion with an excess of the metal, as ordered in the above process: but iron will dissolve, together with the zinc, to ferrous sulphate. This is converted into ferric salt by chlorine-water, and ferric hydroxide is now precipitated on agitating the liquid with precipitated zinc oxide or carbonate. The filtered liquid is free from the metals named, and on being sufficiently concentrated will yield crystals of pure zinc sulphate.

The same salt is economically prepared on the large scale from zinc-white, or by roasting the native zinc sulphide, ZnS, called *blende*, whereby this compound is oxidized to sulphate; this is extracted with hot water, and the clear solution, evaporated, yields *crude white vitriol*, which should be purified by redissolving it in water, boiling with zinc, treating with chlorine and zinc carbonate, filtering, and evaporating to crystallization; magnesium and alkali sulphates are not removed by this treatment.

Properties.—Zinc sulphate crystallizes readily in large transparent rhombic prisms, which are isomorphous with those of magnesium sulphate. As seen in commerce, it is in small prisms or prismatic needles, obtained by disturbed crystallization from concentrated solutions. On exposure the crystals become slowly opaque from the loss of water of crystallization. When rapidly heated the salt melts. At a higher temperature it is partly decomposed, losing both water and sulphuric acid. When very gradually heated to 50° C. (122° F.) it loses 5 molecules of its water (31.3 per cent.) without melting. At 100° C. (212° F.) a sixth molecule is lost, while the last may be removed by a current of dry air at 110° C. (230° F.). Zinc sulphate is inodorous and has a strongly styptic and nauseous metallic taste and an acid reaction. According to Poggiale, 1 part of the crystallized salt dissolves

at	10°	20°	30°	50°	100° C.,
in	.724	.620	.585	.380	.153 parts of water.

The pharmacopœias give the solubility for 1 part of the salt at 15° C. (59° F.) in 0.74 part (*F. Cod.*), 0.6 part (*U. S.*, *P. G.*), and at 100° C. in 0.2 part (*U. S.*), 0.15 part (*F. Cod.*) of water; also in 0.86 part of glycerin (*F. Cod.*), 3 parts (*U. S.*). Supersaturated solutions are easily obtained, particularly in contact with air which has been previously filtered through cotton. 100 parts of 40 per cent. alcohol dissolve, according to Schiff, only 3.48 parts of the salt, and in strong alcohol it is insoluble. The aqueous solution of zinc sulphate yields white precipitates with barium chloride, with ammonium sulphide, and with potassium ferrocyanide.

Tests.—Commercial or crude zinc sulphate is not sufficiently pure for medicinal purposes; it contains iron, occasionally also copper, aluminum, and calcium sulphate, and sometimes cadmium. These salts and the alkali sulphates cannot be removed by recrystallization. Lead cannot be present in this salt if completely soluble in water, owing to the insolubility of its sulphate; yet the Pharmacopœia mentions it among the possible impurities. If 1 Gm. of zinc sulphate be shaken for some time with 10 Cc. of alcohol, the filtrate should not redden moistened blue litmus-paper, showing the absence of free acid. If a large proportion of chloride be present, the salt will be hygroscopic; a 5 per cent. solution of the salt, acidulated with nitric acid, should not be rendered turbid by silver nitrate. Other possible impurities are detected as follows: The aqueous solution, on being acidulated with hydrochloric acid and treated with hydrogen sulphide, should yield neither a yellow, brown, nor black coloration or precipitate (cadmium, arsenic, copper, and similar metals). In case iron be present the solution will afford with a little potassium ferrocyanide a more or less deep-blue precipitate. An excess of ammonia added to the aqueous solution should yield a clear and colorless liquid; in the presence of copper the color of the solution would be blue, and iron and aluminum would remain undissolved. The solution of the salt, after having been precipitated by ammonium sulphide, or the ammoniacal solution after treatment with hydrogen sulphide, yields a filtrate which on evaporation to dryness and ignition should leave no fixed residue (potassium, sodium, magnesium, and

calcium). Ammonium sulphate is detected by the ammoniacal odor given off on the addition of an excess of potassa or soda. Nitrate is detected by adding to the solution sulphuric acid, test zinc, gelatinized starch, and a little potassium iodide, when the nascent hydrogen will cause the reduction of nitric to nitrous acid, and the latter will liberate the iodine, causing a blue color with the starch.

Composition.—Zinc sulphate has the formula given above, and contains 43.9 per cent. of water, 28.22 per cent. of zinc oxide, and 27.88 per cent. of SO_3. The sulphate may also be obtained with less water by crystallizing from its solution above 30° C. (86° F.).

Action and Uses.—Externally and locally, zinc sulphate acts as a stimulant astringent; it is commonly applied to quicken vital action as well as to check secretion. It enters into a paste which is very useful in *cancrum oris*, and contains, besides, extract of cinchona, catechu, and honey of roses. A similar preparation is to be recommended for *aphthæ*. In *conjunctivitis* and in *gonorrhœa*, in the forming stage, or again on the decline, a solution may be employed containing about Gm. 0.06 in Gm. 32 (gr. j–ʒj). In *ophthalmia neonatorum* the following has been used as a collyrium: R. Zinc sulphate gr. xx; water fʒx; solution of lead subacetate fʒss; tincture of camphor fʒj–ij.—A small portion of this solution may be injected between the eyelids several times a day. A solution applied with a brush or sponge to the *throat* or *larynx* should not exceed the strength of Gm. 0.60 to Gm. 32 (10 grains to the ounce); an atomized solution for inhalation may contain Gm. 0.06 to Gm. 32 (gr. j–ij to fʒj). In the first-named form it is useful in commencing inflammation of the fauces. To arrest *hæmorrhage* it is often used in solution and injected into the bladder, uterus, rectum, or nostrils, though for all except the first-mentioned ease it is more efficient when applied upon a sponge. In powder this salt has been employed by insufflation in the treatment of *polypi* of the nostrils, and in solution applied to the seat of these growths after evulsion and to prevent their reproduction. Sir J. Y. Simpson recommended a paste made with lard and the sulphate Gm. 8 to Gm. 32 (ʒij in ℥j), or a glycerite made with glycerin and the same amount of the sulphate Gm. 2.60 to Gm. 32 (gr. xl and ℥j), for the treatment of ulcers and soft *tumors* about the vagina, anus, etc., which it dries and shrivels; and if the part be very soft and of feeble vitality, it may produce a superficial eschar. The same preparations have been applied to *lupus exedens*, *tumors* of the female *urethra*, etc., and even to *cancer* of the breast (*Med. News*, xl. 401). They will not act upon parts covered with cuticle or epithelium. The application causes severe pain, which may be palliated or prevented by chloral hydrate; its action does not tend to spread, and the eschar, if any, separates more rapidly than that of most other caustics. Zinc sulphate may be used in weak solution to lessen the secretion in *eczema* and appease the *itching* in that and other cutaneous affections.

Internally, zinc sulphate is given chiefly as an *emetic* to empty the stomach of indigestible or poisonous ingesta, especially such as are not themselves local irritants, and notably narcotic poisons, such as opium, strychnine, mushrooms, rhus toxicodendron, etc. As it is a mechanical and not a sedative emetic, it is greatly to be preferred before tartarized antimony in these cases, and also when the *air-passages* are obstructed by foreign bodies or by *false membrane*, as in *croup* and occasionally in *diphtheria*. It was claimed in 1879 by Fukala that he cured sixty-two out of seventy-two cases of *pseudo-membranous croup* by repeated applications of a 2½ per cent. solution of zinc sulphate to the interior of the larynx by means of a syringe with a long curved pipe (*Bull. de Thérap.*, xcvii. 143). Evidently the statement is inadmissible. This medicine has been used alone or combined in *dysentery* and *typhoid fever*, but it is only in the chronic form of the first-named disease, and in greatly prolonged cases of the latter with predominant intestinal symptoms, that it is indicated. In *atonic dyspepsia*, with flatulent distension of the digestive canal, it is certainly of use, perhaps by its stimulant and astringent operation. It is reported to be efficacious in nervous *palpitation* of the heart, but probably in dyspeptic cases only. Possibly, a similar explanation may be applied to its alleged success in *spasmodic asthma*, but when this affection is associated with bronchorrhœa the efficiency of the medicine is more probable. In *whooping cough* it has enjoyed a certain reputation which may have been due to a similar mode of action—*i. e.* to its influence in eliminating the catarrhal element. Certainly, when associated with belladonna its usefulness is increased. The efficacy claimed for it in *chorea* is not sufficiently demonstrated. Very often it was associated with valerian, which of itself is at least as potent as the zinc. (Compare *Med. News*, xli. 261.) The latter is, however, as much to be depended upon as any other single medicine.

As an emetic zinc sulphate may be prescribed in *doses* of Gm. 0.60–4 (gr. x–lx) dissolved in tepid water. Internally, Gm. 0.06–0.18 (gr. j–iij) may be given several times a day, and gradually increased. In the treatment of chorea it has been so given until more than 20 grains a day were taken, and without injurious effects. It is best administered in pill and after meals, except when it is intended to act upon the stomach itself.

A solution of *zinc sulphide* has been prepared by dissolving equal parts of zinc sulphate and potassium sulphide in water. Such a solution, containing from 5 to 15 grains of each salt in an ounce of water, with the addition of a few drops of alcohol, is recommended by Duhring in the superficial inflammatory form of *lupus erythematosus* and in *seborrhœa* of the face. The lotion should be shaken before being applied by means of a sponge or rag mop, and its sediment should be allowed to adhere to the surface. Its immediate effect is said to be soothing and cooling in the first-named disease, and its permanent influence more favorable than that of the numerous applications which are apt to be fruitlessly made in this affection (*Med. News*, xliii. 507).

ZINCI VALERIANAS, *U. S., Br.*—Zinc Valerianate.

Valeras zincicus, F. Cod.; *Zincum valerianicum*.—*Valérianate* (*Valérate*) *de zinc*, Fr.; *Zinkvalerianat, Baldriansaures Zinkoxyd*, G.; *Valerianato de zinc*, Sp.

Formula $Zn(C_5H_9O_2)_2.2H_2O$. Molecular weight 302.56.

Preparation.—Take of Sodium Valerianate 5 oz. av.; Zinc Sulphate 5½ oz. av.; Distilled Water a sufficient quantity. Dissolve the salts separately, each in 2 pints (Imperial) of distilled water; raise both solutions to near the boiling-point, mix them, cool, and skim off the crystals which are produced. Evaporate the mother-water at a heat not exceeding 200° F. to 4 fluidounces, cool again, remove the crystals which have formed, and add them to those which have already been obtained. Drain the crystals on a paper filter, and wash them with a small quantity of cold distilled water till the washings give but a very feeble precipitate with barium chloride. Let them now be again drained and dried on filtering-paper at ordinary temperatures.—*Br.*

The above process was originally proposed by Trommsdorff. On mixing hot solutions of sodium valerianate and zinc sulphate the salts are mutually decomposed, resulting in the formation of sodium sulphate, which remains dissolved, and zinc valerianate, which crystallizes partly on cooling, the remainder being obtained on concentrating the liquid.

The salt of the French Codex is obtained by adding freshly-prepared moist zinc carbonate to valerianic acid, diluted with 30 parts of water, and when the acid is nearly saturated warming the mixture slightly, filtering, and carefully evaporating the liquid.

Properties.—Zinc valerianate crystallizes in soft white pearly scales, which are not deliquescent, and have a slight odor of valerianic acid, and a sweet styptic and metallic taste. It has an acid reaction on litmus-paper, melts at about 140° C. (284° F.), at a higher heat gives off white inflammable vapors, and finally burns with a bluish flame, leaving zinc oxide. The salt is stated to be soluble at 15° C. in 90 (*P. G.* 1872), 100 (*U. S.*), 160 (Wittstein) parts of water; the salt used in France, which contains $12H_2O$, dissolves in 50 parts of cold water (*F. Cod.*); on being boiled with water it loses water of crystallization. But, according to Lieben and Rossi (1871), 100 parts of water dissolve at 25° C. (77° F.) 2.54 parts of anhydrous zinc valerianate. On heating the solution moderately it becomes turbid, and clear again on cooling; but after the saturated solution has been boiled it does not become entirely clear after cooling, in consequence of the production of a basic salt, which is less freely soluble in water. The salt is also soluble in 40 (*U. S.*), 60 (Wittstein) parts of cold alcohol, and this solution is likewise rendered turbid by heat. Hot ether, however, dissolves it more freely than cold ether. When kept over sulphuric acid the salt becomes anhydrous.

Tests.—Zinc valerianate should be completely soluble in ammonia-water. Its aqueous solution yields a white precipitate with hydrogen sulphide, and when an excess of the reagent has been used the filtrate on being evaporated should leave no fixed residue. Zinc acetate, being freely soluble in water, if present as an adulteration would impart a red color to solution of ferric chloride. Zinc butyrate resembles the valerianate closely; it is detected, according to the British Pharmacopœia, by distilling the suspected salt with dilute sulphuric acid and adding the distillate to a solution of copper acetate, when, if the valerianate be pure, it does not immediately affect the transparency of the fluid, but forms after a little time oily drops, which gradually pass into a bluish-white crystalline deposit. This is the test suggested by Larocque and Huraut, who first directed

attention (1846) to the similar physical properties of the two salts. The U. S. P. has adopted Hager's test, using cold concentrated solutions of zinc valerianate and copper acetate.

Action and Uses.—Zinc valerianate was originally supposed to unite in itself the peculiar virtues of both of its two elements. This illogical and unscientific judgment did not prevent it from being largely used in spite of its high price and excessively offensive smell. It is very doubtful whether valerianic acid possesses any medicinal virtues; those belonging to valerian seem to reside in its oil. For a time zinc valerianate was lauded in *neuralgia*, both external and internal, in *nervous headache*, *nervous vertigo*, *whooping cough*, infantile *convulsions*, and a variety of nervous and *hysterical* affections, including *chorea*. It was even declared to be a remedy for *cholera!* The only real merit it possesses consists in its sometimes alleviating neuralgic pains and headache occurring in very excitable or hysterical persons. A case is recorded of its having cured *diabetes insipidus*, but as valerian alone is recognized as one of the best remedies for that disease, and as the patient was also taking opium, the influence of the zinc salt cannot be regarded as proved. A more recent case, however, has given some color to this alleged virtue of the salt (*Lancet*, Oct. 1881, p. 662). The *dose* of this preparation is variously stated at from half a grain to several grains. Probably Gm. 0.06 (gr. j) should be the average dose. It may best be given in pill with mucilage or conserve of roses.

ZINCUM, *U. S.*, *Br.*—Zinc.

Speltrum.—Zinc, Fr.; *Zink*, G.

Symbol Zn. Atomicity bivalent. Atomic weight 65.10.

Origin.—The metal zinc has been known in the isolated state only since about the beginning of the eighteenth century, when Stahl showed it to be obtainable from calamine; some of its compounds, however, have been long known. Brass was used in ancient times, but no other metal, besides copper, was supposed to exist therein. The oxide was likewise known at an early date, and, like the ore from which it was obtained, was called *cadmia*. White vitriol appears to have been prepared by Valentinus in the fifteenth century, who was also acquainted with blende, in which Brandt (1735) showed the presence of zinc, and Glauber (1648) prepared "oleum lapidis calaminaris" and studied some of the properties of zinc chloride.

The metal is rather abundant, and exists most generally in combination either as silicate or carbonate, known as *calamine*, or as sulphide, known as *blende*. Zinc ores have been found in Pennsylvania and Missouri, in Great Britain, Belgium, and different parts of Germany, particularly in Silesia. They are frequently associated with lead and other metals.

Calamina præparata, *Br.* (Lapis calaminaris præparata), is native zinc carbonate, calcined in a covered earthen crucible at a moderate temperature, powdered, and freed from gritty particles by elutriation. It is a pale pinkish-brown powder, almost entirely soluble with effervescence in acids. The mineral varies in color from whitish to reddish or greenish, and is sometimes crystalline, or more frequently amorphous.

Preparation.—On smelting lead and other ores containing zinc an impure zinc oxide is condensed in the cooler portions of the furnace. By the long-continued roasting of blende or calamine, oxide is likewise obtained. This is mixed with powdered charcoal, and the mixture heated nearly to whiteness in shallow iron retorts, when the zinc distils, and is collected in suitable condensers. The impure metal is purified by a descending distillation in crucibles furnished with an open tube reaching to the upper half of the crucible and passing through its bottom.

Properties and Tests.—Zinc is a bluish-white metal, having a lamellar or a granular structure. Its density varies between 6.9 and 7.2, rolled zinc being the heaviest. Ordinarily, it is rather brittle, but between 120° and 150° C. (248° and 302° F.) it is ductile, and may be rolled into sheets and converted into wire. Heated to 205° C. (401° F.), it becomes so brittle that it may be reduced to powder. It melts at about 415° C. (779° F.), and at 940° C. (1724° F.) it boils and volatilizes, and in the presence of air burns with a bluish-green flame to oxide. Melted zinc on congealing expands in volume 0.2 per cent. (Nies and Winkelmann 1882), and afterward contracts considerably. On bending, zinc emits a slight cracking noise, weaker than that of tin. It has a bright metallic lustre, but on exposure becomes superficially tarnished. It is not much acted on by cold concentrated sulphuric acid, but on heating unites with it, evolving sulphur dioxide. Diluted sulphuric and hydrochloric acids dissolve it readily, with the evolution

of hydrogen. While the Pharmacopœia permits the presence of traces of iron, lead, and copper, it demands the absence of arsenic, antimony, and phosphorus, as shown by the following tests: When zinc is dissolved in diluted hydrochloric acid, the hydrogen gas which is evolved should not have any disagreeable odor, nor should it color a strip of paper moistened with lead acetate test-solution (absence of sulphur), or with silver nitrate test-solution (absence of arsenic, antimony, phosphorus). If ammonia-water be added to the solution, a white precipitate should form, which should completely redissolve in an excess of the reagent, yielding a clear, colorless solution (absence of more than traces of iron, lead, copper, etc.).

Zinc is extensively used in the arts for roofing and other purposes; melted together with copper it forms *brass*. It is useful in protecting surfaces of iron and copper from oxidation; iron having its surface coated with zinc is known as *galvanized iron*.

The *salts of zinc* are usually colorless, soluble in water, have an acid reaction, and a disagreeable metallic taste, and by prolonged heating are mostly converted into oxide. Their aqueous solutions, acidulated with hydrochloric acid, are not precipitated by hydrogen sulphide, but they yield with ammonia and potassa white precipitates soluble in an excess of the alkali. White precipitates are also obtained with ammonium sulphide, alkali carbonates, and potassium ferrocyanide; potassium ferricyanide yields an orange-red precipitate.

Pharmaceutical Uses.—ZINCUM GRANULATUM, *Br.* Granulated zinc is obtained by melting commercial zinc in an earthen crucible and pouring the liquid metal in a thin stream into cold water. The congealed zinc is drained and dried.

Unofficial Zinc Salts.—ZINCI CYANIDUM, Cyanuretum zincicum, *F. Cod.*, Zinc cyanide, $Zn(CN)_2$. It is obtained by precipitating a solution of zinc acetate with hydrocyanic acid, whereby acetic acid is liberated, which retains a portion of the zinc cyanide in solution; the liquid should therefore be kept nearly neutral by the occasional cautious addition of an alkali. Zinc cyanide is a white, inodorous, and tasteless powder, which is insoluble in water and alcohol, but dissolves in potassa, ammonia, and in dilute acids. When long kept it undergoes decomposition and acquires a sweetish and metallic taste.

ZINCI ET POTASSII CYANIDUM, K_2ZnCy_4. On dissolving zinc cyanide in a solution of pure potassium cyanide a slightly alkaline liquid is obtained, which on evaporation yields colorless or white octahedrons of a sweet and metallic taste. Small quantities of acids precipitate from its solution zinc cyanide.

ZINCI FERROCYANIDUM, Zincum ferrocyanatum, Zinc ferrocyanide. It is prepared by precipitating a soluble zinc salt with potassium ferrocyanide, and forms a white tasteless powder, which is insoluble in water, alcohol, and dilute acids, and evolves hydrocyanic acid on being heated with dilute sulphuric acid.

ZINCI LACTAS, Lactas zincicus, *F. Cod.*, Zincum lacticum, Zinc lactate, $Zn(C_3H_5O_3)_2.3H_2O$. It is prepared as described on page 70, or by dissolving zinc carbonate in dilute lactic acid with the aid of heat. It crystallizes in short quadrangular crystals which have an acid reaction and an acidulous metallic taste. The salt is not fusible, requires about 58 parts of cold and 6 parts of boiling water for solution, and is nearly insoluble in alcohol. It yields 27.1 per cent. of oxide of zinc.

ZINCI SALICYLAS, Zinc salicylate $Zn(C_7H_5O_3)_2.3H_2O$. Vigier (1878) prepares this salt by heating salicylic acid with distilled water, adding gradually zinc oxide suspended in a little water, and, when the oxide is no longer dissolved, filtering the solution. The salt crystallizes in long satiny needles, has a sweet somewhat styptic and bitter taste, dissolves in about 20 parts of cold water, and is freely soluble in hot water, alcohol, ether, and methylic alcohol. The crystals represent 20.6, and the anhydrous salt 23.9, per cent. ZnO.

ZINCI SULPHOCARBOLAS, *Br.*, Zincum sulfocarbolicum (s. sulphophenylicum), Zinc sulphocarbolate, $Zn(SO_3C_6H_4OH)_2.8H_2O$. It is prepared, like the sodium salt (see page 1486), by decomposing a solution of barium sulphocarbolate with zinc sulphate: the precipitate of barium sulphate is filtered off, and the clear liquid evaporated to crystallization. Zinc sulphocarbolate crystallizes in reddish, or if the solution has been acidulated with sulphuric acid in colorless, inodorous prisms or tablets, which are soluble in twice their weight of water or alcohol, have an acid reaction, and when heated are decomposed without melting. The aqueous solution acquires a violet color with ferric chloride, should yield with barium nitrate merely a slight turbidity (sulphate), should not be affected by ammonium oxalate or sulphuric acid (barium, etc.), and after precipitation with excess of ammonium sulphide yields a filtrate which on evaporation and ignition should leave no residue. When heated to redness the salt yields 14.6 per cent. ZnO.

Action and Uses.—Zinc is never used as a medicine in the metallic state. Sheet zinc

has been used to make hollowed and curved splints for fractured limbs, especially for such as are treated by suspension.

Zinc cyanide, according to some early experimenters, occasioned, in doses of half a grain repeated at intervals, cephalic congestion, anxiety, somnolence, nervous tremors, etc. Given in large doses to animals, its effects are identical with those of hydrocyanic acid and its alkaline compounds. It has been used in *epilepsy*, *chorea*, and other convulsive affections, and also in *gastralgia* and other forms of *neuralgia*. In the last-named affection, and especially in neuralgia of the fifth pair produced by cold, its good effects appear to be proven. Lashkewich praises its virtues in *cardiac neuroses* with pain in the heart, palpitation, and disordered rhythm. It may be prescribed in such cases in doses of about Gm. 0.016 (gr. ¼) suspended in mucilage, or preferably in pill, to ensure its more precise administration. It should be given at intervals of an hour or two, since its physiological operation is transient. This salt has also been used with alleged benefit in acute articular *rheumatism*, but the evidence in its favor appears to be inconclusive.

Potassium and zinc cyanide, which is permanent, and also perfectly soluble in cold water, has been proposed, and is to be preferred to zinc cyanide on account of its solubility; it was prescribed in the doses already mentioned in sweetened aromatic water.

Zinc lactate is reputed to be efficacious in the same affections for which the oxide is used, and to be less apt than the latter to disagree with the stomach. Its *dose* is stated to be Gm. 0.03–0.08 (gr. ½–1) several times a day.

Zinc salicylate is believed to be a valuable astringent and antiseptic agent. It has been applied to cancerous and other *ulcers*, and used for the treatment of *ophthalmia* and *gonorrhœa*, in a solution containing from ½ to 1 per cent. of the salt.

Zinc sulphocarbolate has been employed externally as a substitute for carbolic acid in surgical dressings, for the prevention of *septicæmia*, and as an injection in *gonorrhœa*, *leucorrhœa*, etc. It is less liable than carbolic acid itself to act as an irritant. A solution in water of the strength of from 1 to 5 per cent. is used as a topical application, and for injections one of from 1 to 5 parts in 1000.

ZINGIBER, *U. S.*, *Br.*—Ginger.

Rhizoma (*Radix*) *zingiberis*, P. A., P. G.—*Gingembre* (*gris et blanc*, Cod.), Fr.; *Ingwer*, G.; *Zengibre*, Sp.

The rhizome of Zingiber officinale, *Roscoe*, s. Amomum Zingiber, *Linné*. Woodville, *Med. Bot.*, plate 11; Bentley and Trimen, *Med. Plants*, 270.

Nat. Ord.—Scitamineæ (Zingiberaceæ).

Origin.—The ginger-plant is a perennial herb indigenous to tropical Asia, and at the present time cultivated in most tropical countries, but it is not known in the wild state. It has numerous stems, about 1 M. (40 inches) high, and covered with elongated leaf-sheaths, of which the upper ones have a lancelinear spreading blade 20 to 30 Cm. (8–12 inches) long. The flowering stems are much shorter, have a few loose leaf-sheaths, and are terminated by a short thick spike of bracted yellow and variegated flowers. The rhizome is the part employed. 4,277,110 pounds of ginger were imported into the United States in 1886.

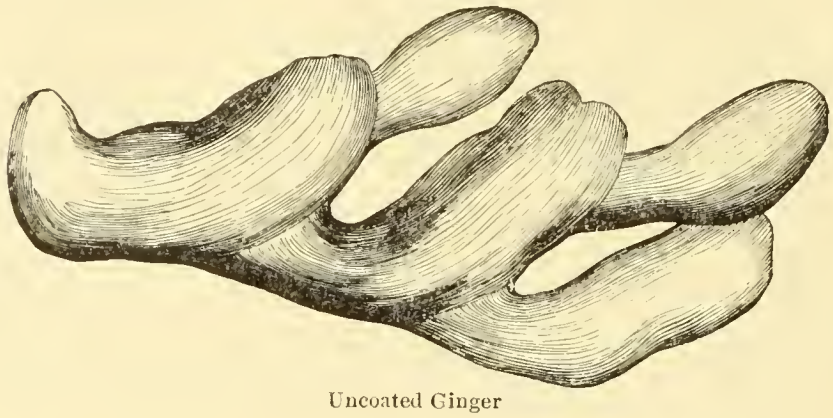
Description.—Ginger is seen in commerce in two forms—either with the outer integuments present or else removed by scraping. The former kind is called *coated*, the latter kind *uncoated* or *scraped* ginger; and this variety is recognized by the pharmacopœias. Commercial ginger consists of flattened branches of the horizontal rhizome, which are somewhat palmately lobed, are known in commerce as *races* or *hands*, and bear at the somewhat thickened end of each lobe a scar from the overground stem. The coated variety has simply been washed and dried, or slightly scraped upon the flattened sides; it is externally of a brown or yellowish-brown color, wrinkled, somewhat annulate from the leaf-bases, and has a more or less shrivelled appearance. The uncoated ginger is of handsomer appearance, of a pale-buff color, striated, and nearly smooth externally, or somewhat fibrous from detached fibro-vascular bundles; it breaks with a mealy and rather fibrous fracture, which is of a whitish or yellowish color. Well-dried coated ginger is slightly darker internally, but some varieties are quite dark-colored and break with a horny fracture. Coated ginger is often designated as *black ginger*, though this name

Fig. 317.

Coated Ginger.

is sometimes restricted to the horny kind, which appears to have been dried by artificial heat or after having been scalded in boiling water. Uncoated ginger is sometimes called *white ginger;* and this name is also used for certain varieties which have been artificially bleached, it is stated, by exposure to the fumes of burning sulphur, whereby they acquire

Fig. 318.



Uncoated Ginger

a chalky color, or by immersion in chlorinated lime or in milk of lime or gypsum. The calcareous coating protects ginger for a long time against the attacks of insects, to which the other, more particularly the coated, varieties of the drug are subject. Ginger has an agreeable aromatic odor and a warm, pungent taste. A transverse section shows near the surface an endoderm, and outside of this numerous small cells containing oil and resin; the central portion contains in the rather compact parenchyma many scattered small fibro-vascular bundles and a somewhat smaller number of oil-cells. The starch-granules of ginger are flat, vary in shape between narrow and broadly elliptical or ovate, have a small hilum near the narrow end, and are marked by numerous fine lines. They resemble the starch-granules of East India arrowroot, but are smaller. (See the article *Amylum.*)

The variety of ginger preferred in the United States is known as *Jamaica ginger*, comes chiefly from Jamaica, and is distinguished by being longer and having more slender lobes than the African and East Indian varieties. Jamaica ginger affords a yellowish powder; that of the other varieties is darker-colored. Scraped ginger is directed by the U. S. and British, the unscraped or partly scraped rhizome by the Austrian and German pharmacopœias, while the French Codex recognizes the two varieties.

Constituents.—The analysis of ginger by Bucholz (1817) proved the presence of volatile oil, a pungent soft resin, starch, and gummy and extractive matters. *Oil of ginger* is obtained to the amount of about ¾ to 1½ or 2 per cent., has a pale-yellow color, the specific gravity 0.88 or 0.90, and has the peculiar odor of ginger, but rather a mild taste. According to Paposek. it is a hydrate of $C_{10}H_{16}$. J. C. Thresh (1881) found the oil to boil between 150° and 300° C. (302°–572° F.), and to contain hydrocarbons of the formula $C_{15}H_{24}$, cymene, a little formic and acetic acids, and various oxygenated compounds, without notable quantities of ethers and aldehydes. Thresh (1879–82) recognized in ginger the presence of traces of an alkaloid, and named the pungent principle *gingerol.* It is a straw-colored, viscid, odorless fluid, has an extremely pungent taste, is sparingly soluble in petroleum benzin, freely soluble in alcohol, diluted alcohol, benzene, volatile oils, carbon disulphide, alkalies, and glacial acetic acid. It is not a glucoside, has an alkaline reaction, gives precipitates with lead, barium, and magnesium salts, slowly loses weight at 100° C., is decomposed by boiling water and alkali, and readily oxidized; its isolation is a matter of great difficulty. Jamaica ginger yields the smallest, and African ginger the largest, amount of volatile oil, resins, and gingerol, and the former variety yielded the largest percentage of mucilage, metarabin, starch, and albuminoids. F. M. Siggins (1888) obtained from bleached and unbleached Jamaica ginger 4.8 and 5 per cent.; from East India ginger, 6.6 per cent.; and from African ginger, 6.2 to 7 per cent. of alcoholic extract. Stenhouse and Groves (1877) obtained a little protocatechuic acid on melting the resinous extract with soda. Thresh ascertained that the greater portion of the resin is a neutral compound, and the remainder consists of two

Fig. 319.

Ginger Starch-Granules.

Fig. 320.

Transverse section, magnified 3 diam.

acid resins. According to E. W. T. Jones (1886), ginger contains fully 50 per cent. of starch. The ash of air-dry ginger varies between 3.5 and 4.8 per cent., and the moisture between 13.4 and 14.5 per cent.

Other Products of Zingiberaceæ.—Zingiber (Amomum, *Linné*) Zerumbet, *Roscoe*, yields the *zerumbet-root* of Java. The rhizome is tuberous, somewhat flattened, spongy, internally yellowish, with pale-brown fibro-vascular bundles, and has an agreeable odor and a ginger-like, somewhat bitter taste.

Zingiber Cassumunar, *Roxburgh*. The cassumunar-root of India is about 5 Cm. (2 inches) in diameter, jointed, compressed, with numerous white fleshy radicles and some white tubers; it is externally scaly and light-brown, internally yellow and rather woody, and has a camphoraceous odor and a hot, aromatic taste.

Grana paradisi, Grains of paradise. Under this name the seeds of two plants are met with in commerce which resemble cardamom-seeds in size and appearance, but are destitute of the furrow seen on the latter. One variety is about 2 Mm. ($\frac{1}{12}$ inch) in diameter, is irregularly roundish and angular, reddish-brown, somewhat glossy and finely warty on the surface, and has a rather broad and depressed hilum; it has been referred to Amomum Granum-paradisi, *Afzelius*, a native of Sierra Leone. The other variety is obtained from Amomum Melegueta, *Roscoe*, which is likewise indigenous to Western Africa; the seeds are rather larger, 2 or 3 Mm. ($\frac{1}{12}$–$\frac{1}{8}$ inch) in length, and are distinguished from the preceding by the conical gray-brown tufted hilum; they are also known as *melegueta pepper* and *Guinea grains*. Both varieties are feebly aromatic and have a very pungent and burning taste. They yield about 0.3 per cent. of aromatic volatile oil, and contain acrid resin, starch, gum, etc. Grains of paradise are a constituent of some cattle powders, but are chiefly used for imparting artificial strength to liquors.

See also Cardamomum, Curcuma, Galanga, and Zedoaria.

Medical Action and Uses.—Ginger was introduced from Asia through Arabia into Greece and Europe generally, and the Arabian and the later Greek physicians employed it as a condiment and carminative, and also as an aphrodisiac and general stimulant. They also recognized the effect of its excessive use in debilitating the stomach. It is a carminative stimulant when taken internally, and when applied to the skin it occasions redness, heat, and tingling. Snuffed into the nostrils, its powder is a powerful sternutatory, and when the rhizome is chewed it causes a copious secretion of saliva. Ginger is largely employed in cooking, as the spices proper are, to render more digestible various preparations of flour, sugar, and certain vegetables, and also to expel the flatus produced by the decomposition of food in the digestive canal. In *flatulent colic* ginger is prescribed in powder or in tincture as a carminative and anodyne. It may be given in powder mixed with hot water, but the tincture is preferable. The infusion and tincture have been largely used to correct *diarrhœa* occasioned by cold, and even for a similar purpose in the forming stage of epidemic *cholera*. Ginger has also been recommended in *chronic bronchitis*.

As a rubefacient and anodyne it is much employed in cataplasms and fomentations for the relief of *colic*, *muscular rheumatism*, *neuralgia*, *toothache*, *headache*, etc. The infusion is of use in recent cases of relaxation of the *uvula*, and of *aphonia* from a similar condition of the larynx. The rhizome may be used as a masticatory in *paralysis* of the tongue, cheek, and parts supplied by the portio dura of the fifth pair.

The *dose* of powdered ginger is from Gm. 0.60 to 2 (grs. x–xxx). The infusion, tincture, fluid extract, syrup, and oleoresin are officinal.

Grains of paradise are generally ranked with cardamom-seeds, but their acrid and exciting qualities are akin to those of ginger, for which they may in most cases be substituted.

APPENDIX.

List of Reagents and Tests

Employed in Chemical Testing, according to the United States Pharmacopœia.

The insertion of all the official methods as well as solutions, both for qualitative and quantitative tests, is rendered imperative by the frequent reference to the pharmacopœial requirements in the preceding pages.

Strictly pure (distilled) water is to be used in the preparation of the test-solutions as well as in the application of tests; the former should be perfectly transparent and kept in well-stoppered bottles, protected against extremes of temperature.

1. General Reagents and Test-solutions.

Absolute Alcohol.—Use the official absolute alcohol (see page 147).

Acetic Acid.—Use the official acetic acid (see page 20).

Albumen Test-solution.—Carefully separate the white of a hen's egg from the yolk, shake it thoroughly with 100 Cc. of water, and filter. This solution should be freshly made when required.

Aluminum.—Metallic aluminum in the form of foil, wire, or ribbon. It should be tested for arsenic by Fleitmann's method, when no color should be imparted to the silver nitrate within two hours.

Ammonia-water.—Use the official ammonia-water (see page 248).

Ammonium Carbonate Test-solution.—Dissolve 10 Gm. of official ammonium carbonate in a mixture of 10 Cc. of ammonia-water and 40 Cc. of water. For detecting arsenic sulphide in presence of antimony sulphide, the addition of ammonia-water is omitted, and 10 Gm. of the salt are dissolved in a sufficient quantity of water to make 100 Cc.

Ammonium Chloride Test-solution.—Dissolve 10 Gm. of pure ammonium chloride in enough water to make 100 Cc.

Ammonium Molybdate Test-solution.—Dissolve 1 Gm. of finely powdered ammonium molybdate in 6.7 Cc. of hot water, using a little ammonia-water, if necessary, to effect solution. Then gradually pour the liquid into a mixture of 3.3 Cc. of nitric acid (spec. grav. 1.414) and 3.4 Cc. of water. Preserve the test-solution in the dark, and, if a sediment should form in it after some days, carefully decant the clear solution from it.

Ammonium Oxalate Test-solution.—Dissolve 4 Gm. of pure, crystallized ammonium oxalate in enough water to make 100 Cc. Or dissolve 4 Gm. of pure oxalic acid in 100 Cc. of water, add 20 Cc. of ammonia-water, boil to expel excess of ammonia, and bring the volume to 113 Cc.

On evaporating a portion of the test-solution and igniting the residue, it should be completely volatilized (absence of fixed impurities). The test-solution should not be rendered turbid by hydrogen sulphide nor by ammonium sulphide (absence of metals). The precipitate produced in it by silver nitrate or by barium chloride should dissolve without residue upon addition of nitric acid (absence of chloride and sulphate, respectively).

Ammonium Phosphate Test-solution.—Dissolve 1 Gm. of ammonium phosphate, together with 2 Cc. of ammonia-water, in enough water to make 100 Cc. This solution does not keep well. It should be freshly made when required, or frequently renewed.

Ammonium Sulphide Test-solution.—Saturate 3 parts of pure ammonia-water with pure, washed hydrogen sulphide, and add to the solution (which now contains ammonium sulphhydrate) 2 parts of ammonia-water, which converts the greater portion of the ammonium sulphhydrate into ammonium sulphide. The solution should be perfectly clear and colorless, and, on being evaporated, leave no residue. It should not be rendered turbid either by magnesium sulphate (absence of free ammonia) or by calcium chloride (absence of ammonium carbonate). It should be protected against air and light by being kept in small, dark amber-colored bottles in a dark place. As soon as a notable deposit of sulphur has made its appearance in the solution, it should be rejected.

Ammonium polysulphide test-solution is occasionally required. This is a yellow liquid, prepared by dissolving a small quantity of pure sulphur in the preceding colorless ammonium sulphide test-solution.

Arsenic Test, Bettendorff's.—To a small quantity of the liquid to be tested, which should contain much pure, concentrated hydrochloric acid, or should be a solution of the substance to be tested in pure, concentrated hydrochloric acid, add an equal volume of a saturated solution of freshly prepared stannous chloride in pure, concentrated hydrochloric acid, together with a small piece of pure tin-foil. The presence of arsenic is revealed by the production of a brown color or brown precipitate, the appearance of which is hastened by a gentle heat. (See *Stannous Chloride*).

Arsenic Test, Fleitmann's.—Into a test-tube of at least 15 Cm. in length and 15 to 18 Mm. in diameter place a single, solid piece of zinc (see below), weighing about 1 to 1.25 Gm., and add about 5 Cc. of potassium hydroxide test-solution, both ingredients having previously been proven free from arsenic by having been subjected, *alone*, to the test about to be described, during at least two hours, with negative result. Now add the liquid to be tested, which must not contain any free acid nor very materially increase the

volume of the contents of the test-tube. Immediately secure over the mouth of the test-tube a previously prepared cap made of three thicknesses of pure filter-paper free from dust, and apply to the upper filter-paper a drop of a saturated, aqueous solution of silver nitrate acidulated with nitric acid. (See Silver Nitrate test-solution.) Then place the tube at once, upright, into a box containing sand heated to about 90° C. (194° F.), and fitted with a cover, so as to exclude light and dust, and permit the reaction to proceed for such a time as may be specially prescribed in each case. The presence of arsenic (but not of antimony) is revealed by the production, upon the moistened paper cap, of a brown or black stain. In absence of arsenic, if the test has been carefully conducted, the spot will remain colorless.

In place of zinc, metallic aluminum, best in form of wire cut into small pieces, may be employed (*Gatehouse's* modification). The method of testing and the results are the same as in Fleitmann's test.

Arsenic Test, Gutzeit's.—Into a test-tube of at least 15 Cm. in length and 15 to 18 Mm. in diameter place a single, solid piece of zinc (see below) weighing about 1 to 1.25 Gm., and add about 5 Cc. of a mixture, previously prepared and kept in readiness for this purpose, of 10 Cc. of pure sulphuric acid of spec. grav. 1.835, and 190 Cc. of water, the ingredients having previously been proven free from arsenic by having been subjected, *alone*, to the test about to be described, during at least two hours, with negative result. Now add the liquid to be tested, which should not be alkaline nor exceed 1 Cc. About 1 Cm. below the open end of the test-tube insert a loose plug, about 1 Cm. long, of glass-wool or cotton, which has been moistened with 0.5 Cc. of lead acetate test-solution. Then secure over the mouth a cap made of three thicknesses of clean filter-paper, and apply to the upper one a drop of a saturated, aqueous solution of silver nitrate, acidulated with nitric acid. (See Silver Nitrate test-solution.) Place the tube into a box to exclude light, and let the reaction proceed as long as may be prescribed in each case. The presence of arsenic is revealed by the production, upon the moistened paper cap, of a bright yellow stain, which becomes black or brown by application of water. Antimony colors the spot black or brown at once without a previous yellow color. In this case traces of arsenic may be overlooked; it is therefore advisable to subject a fresh specimen of the solution to be tested to Fleitmann's test, which responds only to arsenic. If the plug moistened with lead acetate solution be strongly colored, so that doubt exists whether the coloration be due to metallic silver reduced by arsenic, or to silver sulphide produced by an escape of hydrogen sulphide through the plug, moisten the silver stain with diluted nitric acid, which will dissolve the metallic silver reduced by arsenic, but will not affect the black silver sulphide. Or else put on a new cap of filtering paper, moistened with a drop of lead acetate test-solution. If this remains colorless, sulphide is absent.

Barium Carbonate.—Pure barium carbonate, prepared by dissolving 12 parts of pure, crystallized barium chloride in 20 parts of boiling water, then adding a solution of 5 parts of ammonium carbonate in 10 parts of boiling water, and afterward 5 parts of ammonia-water; finally washing the precipitate thoroughly and drying it.

Barium Chloride Test-solution.—Prepared from pure barium chloride. The aqueous solution of the salt should be perfectly neutral, and should not yield a precipitate with hydrogen sulphide or ammonium sulphide (absence of metals, etc.). The aqueous solution, after being precipitated by diluted sulphuric acid in slight excess, yields a filtrate which should not leave any permanent residue when evaporated and heated on platinum-foil (absence of other fixed bases and salts). Diluted alcohol, after remaining in contact with it for several hours, should, upon ignition, show a pure yellowish-green colored flame, without red streaks (absence of traces of strontium). To prepare the *test-solution*, dissolve 12.2 Gm. of the salt in enough water to make 100 Cc. (This solution is of normal strength, so as to permit of its use for volumetric purposes also.)

Barium Hydroxide Test-solution.—A saturated solution of barium hydroxide in water. This solution rapidly absorbs carbon dioxide from the air. It is preferably prepared freshly as wanted.

Barium Nitrate Test-solution.—Prepared from pure barium nitrate. This salt should respond to the same tests as barium chloride. In addition, its aqueous solution, slightly acidulated with nitric acid, should not be rendered turbid by silver nitrate (absence of chloride). To prepare the *test-solution* dissolve 1 Gm. of the salt in water, to make 15.3 Cc. (This solution is of half normal strength, so as to permit of its use for volumetric purposes also:)

Benzin, or **Petroleum Ether.**—Use the official benzin (see page 333).

Benzene, or **Benzol,** C_6H_6, is a colorless, transparent liquid of a peculiar, aromatic odor, of a spec. grav. of 0.8846 at 15° C. (59° F.), congealing at 0° C. (32° F), and boiling at 80.37° C. (176.7° F.). It is insoluble in water, but soluble in 4 parts of alcohol and in ether. In concentrated sulphuric acid it should dissolve without producing a color. On shaking 2 Cc. of benzene with 0.5 Cc. of sulphuric acid and 1 drop of fuming nitric acid no green or blue tint should be produced (absence of thiophene).

Brazil-wood Test-solution.—See under *Indicators.*

Bromine-water (Bromine Test-solution).—An aqueous solution of bromine prepared by dissolving 1 Cc. of bromine in enough water to make 100 Cc.

Calcium Chloride Test-solution.—Dissolve 10.925 Gm. of crystallized calcium chloride in enough water to make 100 Cc. (This solution is of normal strength, so as to permit of its use for volumetric purposes also.)

Calcium Hydroxide Test-solution (Lime-water).—Use the official lime-water (see page 952).

Calcium Sulphate Test-solution.—Introduce transparent crystals of native gypsum (selenite), $CaSO_4 + 2H_2O$, into a flask filled with water, and decant the clear, saturated solution when required. 1 part of gypsum requires, at 15° C. (59° F.), 398 parts of water for solution.

Carbon Disulphide.—Use the official carbon disulphide (see page 409).

Chlorine-water (Chlorine Test-solution).—Use the official chlorine-water. Since it rapidly deteriorates by keeping, it should be frequently renewed or freshly prepared when required.

Chloroform.—Use the official chloroform (see page 463).

Cobaltous Nitrate Test-solution.—The crystallized, commercial salt is sufficiently pure if, after it is dissolved in water and the cobalt completely precipitated by ammonium sulphide, the filtrate leaves no residue on evaporation. To make the *test-solution* dissolve 1 Gm. of the salt in 10 Cc. of water.

Cochineal Test-solution.—See under *Indicators.*

Copper (Metallic Copper), in form of wire, foil, or turnings. The commercial article, brightened, if

necessary, by scouring with diluted hydrochloric acid, is suitable for all purposes except testing for arsenic. If required for this purpose, the absence of arsenic must first be proven. A small portion (about 0.5 Gm.) of the copper is to be dissolved in hot, concentrated sulphuric acid, and this solution subjected to Gutzeit's test (see above). No color should be imparted to the silver nitrate within two hours (absence of arsenic).

Cupric Ammonium Sulphate Test-solution.—A solution of cupri-tetrammonium sulphate, $Cu(NH_3)_4SO_4 + H_2O$. To copper sulphate add ammonia-water until the precipitate first formed is nearly, but not completely, redissolved; then filter. This solution is apt to decompose on keeping. It should be made freshly when required.

Cupric Sulphate Test-solution.—Dissolve 10 Gm. of cupric sulphate in enough water to make 100 Cc.

Cupric Tartrate Test-solution.—See under *Volumetric Solutions.*

Corallin Test-solution.—See under *Indicators.*

Diphenylamine, and **Diphenylamine Test-solution.**—See under *Indicators.*

Eosin Test-solution.—See under *Indicators.*

Ether.—Use the official ether. It should be strictly neutral to litmus-paper.

Ferric Ammonium Sulphate Test-solution.—Dissolve 10 Gm. of ferric ammonium sulphate in enough water to make 100 Cc.

Ferric Chloride Test-solution.—Dissolve 10 Gm. of ferric chloride in enough water to make 100 Cc.

Ferrous Sulphate Test-solution.—Dissolve a clear crystal of ferrous sulphate in about 10 parts of water previously boiled to expel air. This solution should be freshly prepared immediately before use.

Ferrous Sulphide.—A heavy solid, in form of black or brownish-black irregular masses or fused into sticks, soluble in sulphuric or hydrochloric acid with copious evolution of hydrogen sulphide. On dissolving 2 Gm. of ferrous sulphide in pure nitro-hydrochloric acid diluted with a little water, evaporating the solution to dryness, and testing the residue for arsenic by Gutzeit's method (see above), no color should be imparted to the silver nitrate within two hours.

Fluorescein Test-solution.—See under *Indicators.*

Gelatin Test-solution.—Dissolve 1 Gm. of isinglass [*Ichthyocolla*, U. S. P.] in 50 Cc. of water by the aid of a gentle heat, and filter if necessary. This solution should be freshly made when wanted for use.

Gold Chloride Test-solution.—The commercial chloride of gold, usually prepared by dissolving gold in nitro-hydrochloric acid and carefully evaporating to dryness, mostly consists of aurochloric acid, $HAuCl_4 + 2H_2O$, which is converted into neutral auric chloride, $AuCl_3$, by fusing it at a temperature not exceeding 150° C. (302° F.), moistening the residue (now consisting of auric and aurous chloride) with enough hot water to produce a syrupy liquid (whereby the aurous chloride is decomposed into auric chloride and metallic gold), and then pouring off the clear liquid from the precipitate. To prepare the *test-solution* dissolve the liquid finally obtained in the before-mentioned process in 20 volumes of water. Or dissolve 1 Gm. of dry auric chloride in 30 Cc. of water.

Hydrochloric Acid, Pure.—In addition to the tests prescribed for this acid by the Pharmacopœia (see page 62), it is required to conform to the following more rigorous tests before it can be employed as a reagent: The addition of 1 Cc. of barium chloride test-solution to 1 Cc. of the acid diluted with 9 Cc. of water should cause no turbidity within twenty-four hours (absence of sulphuric acid). A crystal of diphenylamine dropped into the acid should not turn blue (absence of free chlorine). On substituting it for sulphuric acid in Gutzeit's test, as described above, no color should be imparted to the silver nitrate within two hours (absence of arsenic or antimony).

Hydrogen Sulphide.—A gas generated by treating ferrous sulphide with diluted sulphuric acid, and washing the gas by passing it through water.

Hydrogen Sulphide Test-solution, or Hydrosulphuric Acid.—A saturated, aqueous solution of hydrogen sulphide. To prepare about 1 liter of the solution, treat 20 Gm. of ferrous sulphide, in a suitable apparatus, with a mixture of 20 Cc. of pure sulphuric acid, spec. grav. 1.835, and 250 Cc. of water, pass the gas through a wash-bottle containing a small quantity of water, and conduct it into a bottle of the capacity of about 1½ liters, containing 1 liter of water. When the gas is no longer absorbed, transfer the solution to small, dark amber-colored bottles, to be filled nearly to the top, pass a stream of hydrogen sulphide for a few minutes through each, and then at once stopper them tightly, and preserve them afterward in a cool and dark place. Before putting them aside introduce into one of these bottles a few drops of pure hydrochloric acid, and keep it in a warm place during twenty-four hours, after which time no precipitate should be found in it (absence of arsenic). Before any of the solution is used, it should be ascertained that it retains a strong odor of hydrogen sulphide, and that, when it is added to an equal volume of ferric chloride test-solution, a copious precipitate of sulphur is formed at once.

Indigo Test-solution.—Place 6 Gm. (3.3 Cc.) of fuming sulphuric acid into a beaker well cooled by immersion in water, and stir into it, very gradually, 1 Gm. of finely-powdered Bengal indigo. Set the mixture aside for two days, then pour it into 20 Cc. of water, and decant. Or dissolve 1 Gm. of commercial indigo-carmine (the sodium or potassium salt of sulphindigotic acid) in 150 Cc. of water.

Iodine Test-solution.—For preparing the ordinary test-solution (as a reagent for starch, alcohol by iodoform test, etc.) iodine fulfilling the requirements of the Pharmacopœia is sufficiently pure. For this purpose dissolve 1 Gm. of iodine and 3 Gm. of potassium iodide in 50 Cc. of water.

For use in volumetric analysis, or in other cases where the ordinary impurities present in official iodine are objectionable, *Purified Iodine* must be employed.

Iron, Metallic.—Bright and perfectly clean iron in the form of wire, sheet, or filings, according to the uses to be made of it. For making solutions of pure iron salts, fine, thin, bright wire (so-called florists' wire) should be used. For detecting copper, bright pieces of sheet iron or knitting-needles are used; for detecting nitric acid by reduction to ammonia, iron-filings are preferable.

Lead Acetate Test-solution.—Dissolve 10 Gm. of clear, transparent crystals of lead acetate, free from adhering lead carbonate, in enough water to make 100 Cc. Preserve the solution in well-stoppered bottles.

Basic Lead Acetate Test-solution.—Use the official solution of lead subacetate.

Litmus-Paper and **Test-solution.**—See under *Indicators.*

Magnesia Mixture.—Dissolve 10 Gm. of magnesium sulphate and 20 Gm. of ammonium chloride in 80 Cc. of water, add 42 Cc. of ammonia-water, set the mixture aside for a few days in a well-stoppered vessel, and filter. It should never be used freshly made.

Magnesium Sulphate Test-solution.—Dissolve 10 Gm. of magnesium sulphate in enough water to make 100 Cc.

Mercuric Chloride Test-solution.—Dissolve 5 Gm. of mercuric chloride in enough water to make 100 Cc.

Mercuric Potassium Iodide Test-solution.—Use the decinormal mercuric potassium iodide volumetric solution.

Alkaline Mercuric Potassium Iodide Test-solution. (*Nessler's Solution.*)—Dissolve 5 Gm. of potassium iodide in 5 Cc. of hot water, and add to this a hot solution of 2.5 Gm. of mercuric chloride [U. S. P.] in 10 Cc. of water. To the turbid, red mixture add 16 Gm. of potassium hydroxide [*Potassa*, U. S. P.], dissolved in 40 Cc. of water, and finally make up the volume to 100 Cc. A surplus of red mercuric iodide deposits on cooling, and may be left in the bottle, the clear solution being decanted as needed.

Mercurous Nitrate Test-solution, $Hg_2(NO_3)_2 + 2H_2O$.—Into a porcelain capsule put 1 Gm. of pure mercury with 0.5 Cc. of pure nitric acid and 0.5 Cc. of distilled water, and place it for twenty-four hours into a cool, dark room. Separate and drain the crystals, and dissolve them in 100 Cc. of water. Preserve the solution in a dark amber-colored bottle, into which a small globule of mercury has been placed.

Methyl Alcohol, CH_3OH.—For the identification of salicylic acid, the rectified, commercial wood-alcohol, having a specific gravity of about 0.820, is sufficiently pure, if it forms a clear, transparent mixture with an equal volume of distilled water.

Methyl-Orange Test-solution.—See under *Indicators.*

Nitric Acid, Pure.—In addition to the tests prescribed for this acid by the Pharmacopœia (see page 75) it is required to conform to the following more rigorous test before it can be used as a reagent: On supersaturating 0.5 Cc. of the acid with pure potassium hydroxide test-solution, and testing a portion of this solution by Fleitmann's method (see above), no color should be imparted to the silver nitrate within two hours (absence of arsenic).

Fuming Nitric Acid (Red Fuming Nitric Acid).—The commercial acid will answer, if it is of specific gravity of 1.450 or over. It should be carefully kept in glass-stoppered bottles in a cool place.

Oxalic Acid Test-solution.—Use the decinormal volumetric solution.

Phenolphtalein Test-solution.—See under *Indicators.*

Picric Acid Test-solution.—Dissolve 1 Gm. of pure, distinctly crystalline picric acid (trinitrophenol), $C_6H_2(NO_2)_3OH$, in 100 Cc. of water, cool the solution, and filter, if necessary.

Platinic Chloride Test-solution.—Heat 1 Gm. of pure platinum, in chips, with 6 Cc. of concentrated hydrochloric acid to 80° C. (186° F.), and very gradually add 1 Cc. of strong nitric acid (spec. grav. 1.414) until very nearly all the platinum is dissolved. Evaporate the solution to dryness on a water-bath, moisten the residue with a few drops of hydrochloric acid, and again evaporate to expel the excess of acid. Dissolve the residue in 20 Cc. of water. The *test-solution* may also be prepared by dissolving 1.7 Gm. of neutral platinic chloride, $PtCl_4$, or 2.6 Gm. of chloroplatinic acid, $H_2PtCl_6 + 6H_2O$ in 20 Cc. of water. On evaporating a small portion of the solution to dryness and igniting the residue, pure, metallic platinum should be left behind, which should yield nothing soluble to nitric acid.

Potassium Carbonate Test-solution.—Dissolve 10 Gm. of pure anhydrous potassium carbonate [prepared from *Potassii Carbonas*, U. S. P.] in enough water to make 100 Cc.

Potassium Chromate Test-solution.—Dissolve 1 Gm. of potassium chromate, K_2CrO_4, in enough water to make 10 Cc. On adding silver nitrate to a little of the solution, a red precipitate is produced, which should be completely dissolved by nitric acid (absence of chloride). Another portion of the solution, mixed with an equal volume of diluted hydrochloric acid, should yield no precipitate with barium chloride (absence of sulphate).

Potassium Cyanide Test-solution.—This should be freshly prepared, when required, by dissolving 1 Gm. of official potassium cyanide in 4 parts of water.

Potassium Dichromate.—Use the official potassium dichromate.

Potassium Dichromate Test-solution.—Dissolve 10 Gm. of official potassium dichromate in enough water to make 100 Cc.

Potassium Ferricyanide Test-solution.—Dissolve 1 part of potassium ferricyanide in about 10 parts of water. This solution should be made freshly when required, as it is rapidly decomposed by light. A freshly prepared, aqueous solution, when mixed with some ferric chloride test-solution and diluted with water, should show a brown tint, free from turbidity or a shade of green.

Potassium Ferrocyanide Test-solution.—Dissolve 10 Gm. of official potassium ferrocyanide in enough water to make 100 Cc.

Potassium Hydroxide Test-solution.—Use the official solution of potassa (see page 975). For use in Fleitmann's test for arsenic (see above), it should have previously been subjected, by itself, to this test for at least two hours, with negative result (absence of arsenic).

Potassium Iodide Test-solution.—Dissolve 16.556 Gm. of official potassium iodide in enough water to make 100 Cc., and keep the solution in dark amber-colored, well-stoppered bottles to prevent the formation of iodate. The solution should be frequently renewed, or freshly prepared when required. (This solution is of normal strength, so as to permit of its use for volumetric and gasometric purposes also.)

Potassium Nitrate.—The dry salt responding to the tests of purity required by the Pharmacopœia, particularly to those for absence of chloride and sulphate.

Potassium Permanganate Test-solution.—Use the decinormal volumetric solution.

Potassium Sulphate Test-solution.—Dissolve 1 Gm. of official potassium sulphate in enough water to make 115 Cc. (This solution is of decinormal strength, so as to permit of its use for volumetric

purposes also, as a substitute for decinormal sulphuric acid, when it is desired not to disturb the neutrality of a liquid.)

Potassium Sulphocyanate Test-solution.—Use the decinormal volumetric solution.

Pyrogallol.—Use the official pyrogallol, $C_6H_3(OH)_3$ (see page 1335).

Rosolic Acid.—See under *Indicators.*

Silver Ammonium Nitrate Test-solution.—Dissolve 1 Gm. of official silver nitrate in 20 Cc. of water, and add ammonia-water, drop by drop, until the precipitate first produced is almost, but not entirely, redissolved. Filter the solution, and preserve it in dark amber-colored and well-stoppered bottles.

Silver Nitrate Test-solution.—For ordinary purposes use the decinormal volumetric solution. For Gutzeit's test use a saturated solution of silver nitrate in water acidulated with about 1 per cent. of nitric acid.

Silver Sulphate Test-solution.—Dissolve 1 Gm. of official silver nitrate in 0.5 Cc. of warm water, and add 1.5 Cc. of pure, concentrated sulphuric acid. On cooling, small transparent crystals of silver sulphate separate. Carefully pour off the acid liquid, wash the crystals repeatedly, by decantation, with cold water, transfer them to a bottle, add 100 Cc. of water, and agitate so as to produce a saturated solution. For use decant a sufficient quantity of the latter.

Sodium Acetate Test-solution.—Dissolve 10 Gm. of official sodium acetate in enough water to make 100 Cc.

Sodium Bitartrate Test-solution.—Dissolve 150 Gm of tartaric acid in 100 Cc. of hot water, and divide the solution into two equal portions. Neutralize one of these accurately with sodium bicarbonate (which will require about 84 Gm. of this salt), and then add the other portion of the acid solution. On cooling, crystals of sodium bitartrate, $NaHC_4H_4O_6 + H_2O$, will separate. Remove these, dry them, and keep them in well-stoppered bottles. The *test-solution* is freshly prepared, when required, by dissolving 1 Gm. of the salt in 4 Cc. of water.

Sodium Carbonate.—The anhydrous salt, Na_2CO_3, conforming to the tests of purity prescribed by the Pharmacopœia for *Sodii Carbonas*, but absolutely free from chloride or sulphate.

Sodium Carbonate Test-solution.—Dissolve 10.6 Gm. of anhydrous sodium carbonate in enough water to make 100 Cc. (This solution is of double normal strength, so as to permit of its use for volumetric purposes also.)

Sodium Cobaltic Nitrite Test-solution.—$Co_2(NO_2)_6 6NaNO_2 + H_2O$. Dissolve 4 Gm. of cobaltous nitrate, $Co(NO_3)_2 + 6H_2O$ and 10 Gm. of sodium nitrite, $NaNO_2$, in about 50 Cc. of water, add 2 Cc. of acetic acid, and dilute with enough water to make 100 Cc. Should any of the nitrous acid be lost by keeping the solution, a few drops of acetic acid may be added.

Sodium Hydroxide Test-solution.—Use the official solution of soda (see page 981).

Sodium Thiosulphate (Hyposulphite).—Use the decinormal volumetric solution.

Sodium Nitrite, $NaNO_2$.—The purest commercial salt, generally in form of pencils, is sufficiently pure.

Sodium Nitro-prusside Test-solution.—Dissolve 1 part of sodium nitro-prusside, $Na_2Fe(NO)(CN)_5 + 2H_2O$ in 10 parts of water immediately before using.

Sodium Phosphate Test-solution.—Dissolve 10 Gm. of official sodium phosphate, $Na_2HPO_4 + 12H_2O$, in enough water to make 100 Cc.

Stannous Chloride Test-solution.—Heat pure tin, in form of foil or granules, with concentrated hydrochloric acid, taking care that the metal be in excess. When the acid is saturated, crystals of stannous chloride, $SnCl_2 + 2H_2O$, begin to form. Remove and drain these, dissolve them in 10 parts of water, and preserve the solution in well-stoppered bottles, into each of which a granule of pure tin or a piece of pure tin-foil has previously been introduced.

For Bettendorff's test (see above) pure concentrated hydrochloric acid is saturated with the freshly-prepared crystals.

Starch Test-solution.—Mix 1 Gm. of starch with 10 Cc. of cold water, and then add enough boiling water, under constant stirring, to make about 200 Cc. of a thin, transparent jelly. If it is desired to preserve this test-solution for any length of time, 10 Gm. of zinc chloride, $ZnCl_2$, should be added to it, and the solution transferred to small bottles, which should be well stoppered.

Sulphuric Acid, Pure.—The sulphuric acid of the Pharmacopœia, which may have a specific gravity as low as 1.835, will answer as a reagent for most purposes, provided it is of the required degree of purity. But when "concentrated" sulphuric acid is specially directed in a test, it is intended that the strongest obtainable pure acid, of a specific gravity of not less than 1.840, be employed.

In addition to the tests prescribed for this acid by the Pharmacopœia (see page 101), it is required to conform to the following more rigorous tests before it can be employed as a reagent: If 1 Cc. of diphenylamine test-solution be carefully poured, as a separate layer, upon 5 Cc. of sulphuric acid contained in a test-tube, no distinct blue color should appear in the zone of contact (absence of nitric acid). If a few crystals of pyrogallol be dissolved in about 1 Cc. of pure water, and this solution be carefully poured, as a separate layer, upon some of the sulphuric acid contained in a test-tube, no brown color should appear in the zone of contact (absence of nitric or nitrous acid). If a small portion of the acid be subjected to Gutzeit's test, no color should be imparted to the silver nitrate within two hours (absence of arsenic, etc.).

If it is impossible to obtain any sulphuric acid which will comply with each of these requirements, two kinds of the acid may be kept, one absolutely free from arsenic, for making the arsenic tests; the other free nitrose (nitric and nitrous acids), for the detection of nitric acid.

Tannic Acid Test-solution.—Dissolve 1 Gm. of tannic acid in 1 Cc. of alcohol and enough water to make 10 Cc., immediately before use.

Tartaric Acid Test-solution.—Dissolve 1 part of tartaric acid in 3 parts of water. In the volumetric estimation of soda in potassa directed by the Pharmacopœia, the tartaric acid test-solution employed for precipitating the potassa should contain 3 Gm. of the acid in 20 Cc. Since fungous growths rapidly destroy the solution of tartaric acid, it should be prepared only as wanted.

Tin.—Pure metallic tin in form of granules. Its solution in hydrochloric acid should not be precipi-

tated by potassium sulphate test-solution (absence of lead), and, when examined by Gutzeit's test, it should not cause silver nitrate to become colored within two hours (absence of arsenic).

Turmeric Paper and Tincture.—See under *Indicators.*

Zinc.—Metallic zinc, preferably in the form of thin pencils (about 5 Mm. in diameter), prepared by fusing the metal and casting it in moulds, or in form of thin sheets. It should respond to all the tests required by the Pharmacopœia, and in addition, when examined by Gutzeit's test, it should not cause the silver nitrate to become colored within two hours (absence of arsenic).

Zinc-Iodide-Starch Test-solution.—To 100 Cc. of freshly prepared starch test-solution add 5 Gm. of official zinc chloride and 3 Gm. of official zinc iodide. Preserve the colorless solution carefully in small, dark amber-colored and well-stoppered vials.

2. Indicators for Acidimetry, Alkalimetry, etc.

NOTE.—Each test-solution used as *indicator* should be examined as soon as prepared, and afterward from time to time, as to its neutrality. If necessary, it should be brought, by the cautious addition of diluted sulphuric acid, or of a dilute solution of an alkali, to such a point that, when a few drops of it are added to 25 Cc. of water, a single drop of a centinormal acid or alkali solution, respectively, will distinctly develop the corresponding tints.

Since many of the colored test-solutions are injured by exposure to light, it is best to preserve them in dark, amber-colored vials. Papers prepared with them should be kept in dark bottles or paper boxes.

Brazil-Wood Test-solution.—Boil 50 Gm. of finely-cut Brazil-wood [the heart-wood of Peltophorum dubium (*Sprengel*) *Britton*, nat. ord. Leguminosæ] with 100 Cc. of water during half an hour, replacing the water from time to time. Allow the mixture to cool, strain, wash the contents of the strainer with water until 100 Cc. of strained liquid are obtained, add 25 Cc. of alcohol, and filter. This solution turns purplish-red with alkalies, and yellow with acids.

Cochineal Test-solution.—Macerate 1 Gm. of unbroken cochineal during four days with 20 Cc. of alcohol and 60 Cc. of water. Then filter. The color of this test-solution turns violet with alkalies, and yellowish-red with acids. As an indicator it is used chiefly when ammonia or alkaline earths are present.

Corallin Test-solution.—Dissolve 1 Gm. of Corallin (a coloring matter derived from coal-tar, and containing rosolic and pararosolic acids) in 10 Cc. of alcohol and enough water to make 100 Cc.

Diphenylamine $(C_6H_5)_2NH$ is in form of grayish-white or colorless crystals, of a peculiar, aromatic odor, melting at 54° C. (129.2° F.), slightly soluble in water, more soluble in acids. It is used either in the dry state, or in solution in dilute sulphuric acid, as a test for nitric acid (in sulphuric acid, water, etc.), or for chlorine (in hydrochloric acid). To test a solution for the presence of nitric acid, a small portion of it is mixed with 1 or 2 drops of diphenylamine test-solution, and then concentrated sulphuric acid, *free from nitrose*, is poured in, so as to form a layer beneath the solution. The presence of nitric acid is shown by a deep blue color at the zone of contact.

Diphenylamine test-solution is prepared by dissolving 0.1 Gm. of diphenylamine in 50 Cc. of diluted sulphuric acid. The solution should be colorless.

Eosin Test-solution.—Dissolve 1 Gm. of commercial "yellowish" eosin [$K_2C_{20}H_6Br_4O_5$] in 30 Cc. of water. This solution is red by transmitted light, and shows a strong green fluorescence by reflected light. Acids destroy the fluorescence, and alkalies restore it.

Fluorescein Test-solution.—Agitate 1 Gm. of fluorescein [$C_{20}H_{12}O_5$] with 100 Cc. of diluted alcohol until the latter is saturated; then filter. This solution shows a strong green fluorescence, by reflected light, in presence of the least excess of an alkali.

Litmus-Paper and **Test-solution.**—Exhaust coarsely-powdered litmus with boiling alcohol (which removes a peculiar, red coloring matter, erythrolitmin), and digest the residue with about an equal weight of cold water, so as to dissolve the excess of alkali present. The blue solution thus obtained, after being acidulated, may be used to make *red litmus-paper*. Finally extract the residue with about five times its weight of boiling water, and filter. Preserve the filtrate, as *test-solution*, in wide-mouthed bottles stoppered with loose plugs of cotton to exclude dust, but to admit air.

Litmus-Paper, Blue.—Impregnate, with the test-solution just described, strips of white, unsized paper, free from wood-pulp, but not too porous, and dry them by suspending them on strings of clean twine.

Litmus-Paper, Red.—Prepare this with the same kind of paper and in the same manner as described in the preceding paragraph. To impregnate the paper, either use the blue solution obtained from litmus, by treating the mass, after extraction of alcohol, with cold water, acidulating the same with just enough hydrochloric acid to impart to it a distinctly red tint; or use the regular test-solution, after acidulating it in the same manner.

Neither blue nor red litmus-paper should have a very intense color.

Preserve the test-paper in paper boxes or bottles, so as to exclude dust and acid or ammoniacal vapors.

Methyl-orange Test-solution.—Dissolve 1 Gm. of methyl-orange [the sodium or ammonium salt of dimethylamidoazobenzenesulphonic acid, $HC_{14}H_{14}N_3SO_3$; also known as helianthin, or tropæolin D, or Poirrier's Orange III] in 1000 Cc. of water. Add to it carefully, diluted sulphuric acid, in drops, until the liquid turns red and just ceases to be transparent. Then filter.

The solution acquires a yellow color when brought in contact with alkali hydroxides, carbonates, or bicarbonates. Carbonic acid does not affect it, but sulphuric, hydrochloric, and other acids change its color to crimson. It is not suited for use with organic acids.

Phenolphtalein Test-solution.—Dissolve 1 Gm of phenolphtalein [$C_{20}H_{14}O_4$] in 100 Cc. of diluted alcohol. The solution is colored deep purplish-red by alkali hydroxides or carbonates; bicarbonates and most other salts do not produce such color; acids render the reddened solution colorless. It is not suitable as an indicator for ammonia or bicarbonates. *Phenolphtalein Paper* is prepared by impregnating white, unsized paper with the test-solution and drying it.

Rosolic Acid Test-solution.—Dissolve 1 Gm. of commercial rosolic acid [chiefly methylaurin, $C_{20}H_{16}O_3$] in 10 Cc. of diluted alcohol, and add enough water to make 100 Cc. The solution turns violet-red with alkalies, yellow with acids. In place of rosolic acid, commercial pæonin (also known as aurin R) [chiefly $C_{19}H_{14}O_3$] may be employed.

Turmeric Tincture.—Digest any convenient quantity of ground curcuma-root [from Curcuma longa, *Linné*, nat. ord. Scitamineæ] repeatedly with small quantities of water and throw this liquid, away. Then digest the dried residue for several days with six times its weight of alcohol, and filter. *Turmeric Paper.*—Impregnate white, unsized paper with the tincture, and dry it. The tincture, as well as the paper, turns brown with alkalies, and the yellow color is restored by acids. Boric acid, however, even in presence of hydrochloric acid, turns the color to reddish-brown, and this is changed to bluish-black by ammonia.

3. Volumetric Solutions for Quantitative Tests.

Volumetric solutions are designated as normal $\left(\frac{N}{1}\right)$ when they contain in 1 liter the molecular weight of the active reagent, expressed in grammes, and reduced to the equivalent of 1 atom of hydrogen.

Thus hydrochloric acid, HCl = 36.37, having but one H atom replaceable by a basic element, has 36.37 Gm. of HCl in 1000 Cc. of the normal volumetric solution; while sulphuric acid, $H_2SO_4 = 97.82$, having two replaceable H atoms, contains only one-half this number, or 48.91 grammes of H_2SO_4 in 1000 Cc. of its normal solution. Potassium hydroxide, KOH = 55.99, has but one K to replace one H in acids; hence its normal solution contains 55.99 grammes of KOH in 1 liter; potassium dichromate, $K_2Cr_2O_7 = 293.78$, having 2 K atoms in the molecule, requires one-half its molecular weight, or 146.89 grammes, for 1 liter of normal solution.

Solutions containing in 1 liter one-tenth of the quantity of the active reagent in the normal solution are called decinormal $\left(\frac{N}{10}\right)$; those containing one one-hundredth, centinormal $\left(\frac{N}{100}\right)$; those containing twice the amount, double normal $\left(\frac{2}{N}\right)$; half the amount, seminormal $\left(\frac{N}{2}\right)$.

Solutions containing quantities of the active reagent having *no* simple relation to the molecular weight are called empirical.

Alkaline Cupric Tartrate Volumetric Solution, U. S.

[Fehling's Solution.]

A. The Copper Solution.—Dissolve 34.64 Gm. of carefully selected, small crystals of pure cupric sulphate, showing no trace of efflorescence or of adhering moisture, in a sufficient quantity of water to make the solution measure, at or near 15° C. (59° F.), exactly 500 Cc. *B. The Rochelle Salt Solution.*—Dissolve 173 Gm. of potassium and sodium tartrate and 125 Gm. of potassium hydroxide in a sufficient quantity of water to make the solution measure, at or near 15° C. (59° F.), exactly 500 Cc.

Keep the solutions in small, rubber-stoppered bottles. For use, mix exactly equal volumes of the solutions at the time required.

One Cubic Centimeter of the mixed solution is the equivalent of:

	Gramme.
Cupric Sulphate, crystallized, $CuSO_4 + 5H_2O$	0.03464
Cupric Tartrate, $CuC_4H_4O_6 + 3H_2O$	0.03685
Glucose, anhydrous, $C_6H_{12}O_6$	0.00500

Decinormal Bromine Volumetric Solution, U. S.

[Koppeschaar's Solution.]

Br = 79.76. 7.976 Gm. in 1 Liter.

($NaBrO_3 = 150.64$. − NaBr = 102.76.)

($KBrO_3 = 166.67$. − KBr = 118.79.)

Dissolve 3 Gm. of sodium bromate and 50 Gm. of sodium bromide (or 3.2 Gm. of potassium bromate and 50 Gm. of potassium bromide) in enough water to make, at or near 15° C. (59° F.), 900 Cc. Of this solution transfer 20 Cc., by means of a pipette, into a bottle having a capacity of about 250 Cc., provided with a glass stopper; add 75 Cc. of water, next 5 Cc. of pure hydrochloric acid, and immediately insert the stopper. Shake the bottle a few times, then remove the stopper just sufficiently to quickly introduce 5 Cc. of potassium iodide test-solution, taking care that no bromine vapor escape, and immediately stopper the bottle. Agitate the bottle thoroughly, remove the stopper and rinse it and the neck of the bottle with a little water, so that the washings flow into the bottle, and then add from a burette decinormal sodium thiosulphate solution until the iodine tint is exactly discharged, using toward the end a few drops of starch test-solution as indicator. Note the number of Cc. of the sodium thiosulphate solution thus consumed, and then dilute the bromine solution so that equal volumes of it and of decinormal sodium thiosulphate solution will exactly correspond to each other under the conditions mentioned above.

Example.—Assuming that the 20 Cc. of the bromine solution have required 25.2 Cc. of the thiosulphate to completely discharge the iodine tint, the bromine solution must be diluted in the proportion of 20 to 25.2. Thus, if 850 Cc. of it are remaining, they must be diluted with water to measure 1071 Cc.

After the solution is thus diluted, a new trial should be made in the manner above described, in which 25 Cc. of the decinormal sodium thiosulphate solution should exactly discharge the tint of the iodine liberated by the bromine set free from the 25 Cc. of bromine solution.

Keep the solution in dark amber-colored, glass-stoppered bottles.

One Cubic Centimeter of Decinormal Bromine Solution is the equivalent of:

	Gramme.
Bromine, Br.	0.007976
Carbolic Acid, C_6H_5OH	0.001563

The following article is tested with this solution: Acidum Carbolicum.

Normal Hydrochloric Acid.

HCl = 36.37. 36.37 Gm. in 1 Liter.

Mix 130 Cc. of hydrochloric acid of specific gravity 1.163 with enough water to make it measure, at or near 15° C. (59° F.), 1000 Cc. Of this liquid (which is still too concentrated) carefully measure 10 Cc.

into a flask, add a few drops of phenolphtalein test-solution, and gradually add, from a burette, potassium hydroxide solution, until the red tint produced by it no longer disappears on vigorous shaking, but is not deeper than pale pink. Note the number of Cc. of potassium hydroxide solution consumed, and then dilute the acid solution so that equal volumes of this and of the potassium hydroxide solution neutralize each other.

EXAMPLE.—Assuming that 10 Cc. of the acid solution first prepared required exactly 11 Cc. of potassium hydroxide solution, each 10 Cc. of the former must be diluted to 11 Cc., or the whole of the remaining acid solution in the same proportion. Thus, if 950 Cc. are remaining, 95 Cc. of water must be added.

After the liquid is thus diluted, a new trial should be made in the manner above described, in which 50 Cc. of the acid solution should require for neutralization exactly 50 Cc. of potassium hydroxide solution. If necessary, a new adjustment should then be made to render the correspondence perfect.

One Cubic Centimeter of Normal Hydrochloric Acid is the equivalent of:

	Gramme.
Hydrochloric Acid, alsolute, HCl	0.03637

NOTE.—Normal hydrochloric acid is in every respect equivalent in neutralizing power to normal sulphuric acid, and may be employed, if more convenient, for the same purposes.

Decinormal Iodine Volumetric Solution, U. S.

$I = 126.53$. 12.653 Gm. in 1 Liter.

Dissolve 12.653 Gm. of pure iodine (see below) in a solution of 18 Gm. of pure potassium iodide in 900 Cc. of water. Then add enough water to make the solution measure, at or near 15° C. (59 F.), exactly 1000 Cc. Transfer the solution to small, glass-stoppered vials, which should be kept in a dark place.

Preparation of Pure Iodine.—Heat powdered iodine in a porcelain dish placed over a boiling water-bath, and stir it constantly with a glass rod, so that the adhering moisture, together with any cyanogen iodide and most of the iodine bromide and chloride that may be present may be vaporized. After twenty minutes transfer the iodine to a porcelain or other non-metallic mortar, and triturate it with about 5 per cent. of its weight of pure, dry potassium iodide, so as to decompose any remaining iodine bromide and chloride. Then return the mass to the dish, cover it with a clean glass funnel, and heat the dish on a sand-bath. Detach the sublimed, pure iodine, and keep it in well-stoppered bottles in a cool place.

One Cubic Centimeter of Decinormal Iodine Solution is the equivalent of:

	Gramme.
Iodine, I	0.012653
Arsenic Trioxide (arsenous acid), As_2O_3	0.004942
Potassium Sulphite, crystallized, $K_2SO_3 + 2H_2O$	0.009692
Sodium Bisulphite, $NaHSO_3$	0.005193
Sodium Thiosulphate (Hyposulphite), crystals, $Na_2S_2O_3 + 5H_2O$	0.024764
Sodium Sulphite, crystallized, $Na_2SO_3 + 7H_2O$	0.012579
Sulphur Dioxide, SO_2	0.003195
Antimony and Potassium Tartrate, cryst., $2K(SbO)C_4H_4O_6 + H_2O$	0.016560

The following articles are tested with this solution: Acidum Arsenosum, Acidum Sulphurosum, Antimonii et Potassii Tartras (cryst.), Liquor Acidi Arsenosi, Liquor Potassii Arsenitis, Sodii Bisulphis, Sodii Thiosulphas (Hyposulphis), Sodii Sulphis.

Decinormal Mercuric Potassium Iodide Volumetric Solution, U. S.

[MAYER'S SOLUTION.]

$HgI_2 + 2KI = 783.98$. 39.2 Gm. in 1 Liter.

Dissolve 13.546 Gm. of pure mercuric chloride in 600 Cc. of water, and 49.8 Gm. of pure potassium iodide in 100 Cc. of water. Mix the two solutions, and then add enough water to make the mixture measure, at or near 15° C. (59° F.), exactly 1000 Cc.

One Cubic Centimeter of Decinormal Mercuric Potassium Iodide Solution is the equivalent of:

	Gramme.
Mercuric Potassium Iodide, $HgI_2 + 2KI$	0.0392

Normal Oxalic Acid Volumetric Solution, U. S.

$H_2C_2O_4 + 2H_2O = 125.7$ 62.85 Gm. in 1 Liter.

Dissolve 62.85 Gm. of pure oxalic acid (see below) in enough water to make, at or near 15° C. (59 F.), exactly 1000 Cc.

Pure Oxalic Acid, crystallized, is in form of colorless, transparent, clinorhombic crystals which, on ignition upon platinum-foil, leave no residue. 1 part of it is completely soluble in 14 parts of water at 15° C. (59° F.). Oxalic acid which leaves a residue on ignition, or on solution in water, must be purified, which may be done as follows: To 1 part of the acid add 10 parts of cold water, and shake until the latter is saturated. Filter off the solution from the undissolved crystals, evaporate the filtrate to about three-fourths of its volume, and set it aside so that the fixed salts which it contains may crystallize out. Carefully decant the liquid from the crystals, concentrate it by evaporation, and set it aside to crystallize, stirring occasionally to prevent the formation of large crystals which might enclose moisture. Drain the crystals in a funnel, dry them carefully on blotting-paper, and preserve them in well-stoppered bottles.

NOTE.—Normal oxalic acid volumetric solution is in every respect equivalent in neutralizing power to *normal sulphuric acid* or *normal hydrochloric acid*, and may be employed, if more convenient, for the same purposes. The solution, however, has a tendency to crystallize at the point of the burette.

One Cubic Centimeter of Normal Oxalic Acid Solution is the equivalent of:

	Gramme.
Oxalic Acid, crystallized, $H_2C_2O_4 + 2H_2O$	0.06285
Ammonia Gas, NH_3	0.01701
Sodium Hydroxide, NaOH	0.03996
Potassium Hydroxide, KOH	0.05599
Potassium Permanganate, $KMnO_4$	0.03153

Decinormal Oxalic Acid Volumetric Solution, U. S.

$H_2C_2O_4 + 2H_2O = 125.7$. 6.285 Gm. in 1 Liter.

Dissolve 6.285 Gm. of pure oxalic acid (see above) in enough water to make, at or near 15° C. (59° F.), exactly 1000 Cc.

One Cubic Centimeter of Decinormal Oxalic Acid Solution is the equivalent of:

	Gramme.
Oxalic Acid, crystallized, $H_2C_2O_4 + 2H_2O$	0.006285
Ammonia Gas, NH_3	0.001701
Calcium Hydroxide, $Ca(OH)_2$	0.003691
Potassium Hydroxide, KOH	0.005599
Potassium Permanganate, $KMnO_4$	0.003153
Sodium Hydroxide, NaOH	0.003996

The following articles are tested with this solution: Liquor Calcis, Potassii Iodidum (alkalinity), Potassii Permanganas.

Decinormal Potassium Dichromate Volumetric Solution, U. S.

$K_2Cr_2O_7 = 293.78$. 14.689 Gm. in 1 Liter.

Dissolve 14.689 Gm. of pure potassium dichromate (see below) in enough water to make, at or near 15° C. (59° F.), exactly 1000 Cc.

Pure Potassium Dichromate for use in volumetric analysis, besides responding to the tests given by the Pharmacopœia (see page 0000), must conform to the following tests: In a solution of 0.5 Gm. of the salt in 10 Cc. of water rendered acid by 0.5 Cc. of nitric acid, no visible change should be produced either by barium chloride test-solution (absence of sulphate), or by silver nitrate test-solution (absence of chloride). In a mixture of 10 Cc. of the aqueous solution (1 in 20) with 1 Cc. of ammonia-water no precipitate should be produced by ammonium oxalate test-solution (absence of calcium).

When used with phenolphtalein as indicator to neutralize alkalies, the volumetric solution of potassium dichromate is decinormal when it contains 14.689 Gm. in 1 liter. It is then the exact equivalent of any decinormal acid, corresponding to the amounts of alkalies quoted, for instance, under Decinormal Oxalic Acid Solution.

When used as an oxidizing agent to convert ferrous into ferric salts, or to liberate iodine from potassium iodide, the solution just mentioned (containing 14.689 Gm. in 1 liter) has the effect of a $\frac{N}{10}$ volumetric solution, and a solution of one-third of this strength, containing 4.896 Gm. in 1 liter, has the value of a decinormal solution, and is the equivalent of equal volumes of decinormal potassium permanganate solution, or, in the case of iodine liberated from potassium iodide, it is the equivalent of equal volumes of decinormal sodium thiosulphate solution. For titrating iron in *ferrous* compounds it is used in the following manner: Introduce the aqueous solution of the ferrous salt into a flask, and, if it is not already acid, render it so with sulphuric acid. Now add gradually decinormal potassium dichromate solution from a burette, until a drop taken out upon a white surface no longer shows a blue color with a drop of freshly prepared potassium ferricyanide test-solution.

Decinormal potassium dichromate solution may also be used in conjunction with potassium iodide (from which it liberates iodine) and sulphuric acid for adjusting the titer of sodium thiosulphate (hyposulphite) solution, and, by its means, that of the iodine solution.

One Cubic Centimeter of Decinormal Potassium Dichromate Solution is the equivalent of:

	Gramme.
Potassium Dichromate, $K_2Cr_2O_7$	0.014689
Iron, in ferrous compounds	0.016764
Ferrous Carbonate, $FeCO_3$	0.034719
Ferrous Sulphate, anhydrous, $FeSO_4$	0.045510
Ferrous Sulphate, crystallized, $FeSO_4 + 7H_2O$	0.083226
Ferrous Sulphate, dried, $2FeSO_4 + 3H_2O$	0.053592
Barium Hydroxide, $Ba(OH)_2$	0.008541
Iodine, I	0.037959
Potassium Hydroxide, KOH	0.005599
Sodium Thiosulphate (Hyposulphite), $Na_2S_2O_3 + 5H_2O$	0.074292

The following articles may be tested with this solution: Ferri Carbonas Saccharatus, Ferri Sulphas, Ferri Sulphas Granulatus.

Normal Potassium Hydroxide Volumetric Solution, U. S.

$KOH = 55.99$. 55.99 Gm. in 1 Liter.

Dissolve 75 Gm. of potassium hydroxide [*Potassa*, U. S. P.] in enough water to make, at or near 15° C. (59° F.), about 1050 Cc., and fill a burette with a portion of this liquid.

Put 0.6285 Gm. of pure oxalic acid into a flask of the capacity of about 100 Cc., and dissolve it with about 10 Cc. of water. Add a few drops of phenolphtalein test-solution, and then carefully add, from the burette, the potassium hydroxide solution, frequently agitating the flask, and regulating the flow to drops toward the end of the operation, until the red color produced by its influx no longer disappears on shaking, but is not deeper than pale pink. Note the number of Cc. of the potassium hydroxide solution consumed, and then dilute the remainder of the solution, so that exactly 10 Cc. of the diluted liquid shall be required to neutralize 0.6285 Gm. of oxalic acid.

EXAMPLE.—Assuming that 8.0 Cc. of the stronger solution of potassium hydroxide first prepared had been consumed in the trial, then each 8.0 Cc. must be diluted to 10 Cc., or the whole of the remaining solution in the same proportion. Thus, if 1000 Cc. should be still remaining, this must be diluted with water to 1250 Cc.

After the liquid is thus diluted a new trial should be made in the manner above described, in which 10 Cc. of the diluted solution should exactly neutralize 0.6285 Gm. of oxalic acid. If necessary, a new adjustment should then be made to render the correspondence perfect.

NOTE.—Solutions of caustic alkalies are very prone to absorb carbon dioxide from the atmosphere, and thereby become liable to occasion errors when used with litmus test-solution or phenolphtalein test-solution as indicator (methyl-orange test-solution is not affected by the presence of carbonic acid). Hence the volumetric solutions should be preserved in small vials provided with well-fitting corks or rubber stoppers, or, better still, they should have tubes filled with a mixture of soda and lime attached to their stoppers, so as to absorb the carbon dioxide and prevent its access to the solution.

In place of potassium hydroxide solution sodium hydroxide solution may be used in the same manner and in the same quantity. Potassium hydroxide solution, however, is preferable, since it foams less and attacks glass more slowly and less energetically.

One Cubic Centimeter of Normal Potassium Hydroxide Solution is the equivalent of:

	Gramme.
Potassium Hydroxide, KOH	0.05599

Centinormal Potassium Hydroxide Volumetric Soluion, U. S.

$KOH = 55.99$. 0.5599 Gm. in 1 Liter.

Dilute 10 Cc. of normal potassium hydroxide volumetric solution with enough distilled water to make 1000 Cc.

One Cubic Centimeter of Centinormal Potassium Hydroxide Solution is the equivalent of:

	Gramme.
Potassium Hydroxide, KOH	0.0005599
Sulphuric Acid, H_2SO_4	0.0004891
Combined Alkaloids of Nux Vomica[1]	0.00364

Decinormal Potassium Permanganate Volumetric Solution, U. S.

$2KMnO_4 = 315.34$. 3.1534 Gm.[2] in 1 Liter.

1. Place 3.5 Gm. of pure, crystallized potassium permanganate in a flask, add 1000 Cc. of boiling water, and boil until the crystals are dissolved. Close the flask and set it aside for two days, so that any suspended matters may deposit. This is the *stronger solution*. Prepare another, *weaker solution*, in the same manner, using 6.6 Gm. of the salt and 2200 Cc. of water, and set this also aside for two days. After the lapse of this time pour off the clear portion of each solution into separate vessels provided with glass stoppers, and then proceed to test each separately.

Introduce into a flask 10 Cc. of decinormal oxalic acid solution, add 1 Cc. of pure, concentrated sulphuric acid, and, before this mixture cools, gradually add from a burette small quantities of the weaker permanganate solution, shaking the flask after each addition and reducing the flow to drops toward the end of the operation. When the last drop of the permanganate solution added is no longer decolorized, but imparts a pinkish tint to the liquid, note the number of Cc. consumed. In the same manner ascertain the titer of the stronger solution, and likewise note down the number of Cc. of the latter consumed. Finally mix the two solutions in such proportions that 50 Cc. of the mixture will exactly correspond to an equal volume of decinormal oxalic acid solution.

NOTE.—To obtain the accurate proportions for mixing the two solutions, deduct 10 from the number of Cc. of the weaker solution required to decompose 10 Cc. of decinormal oxalic acid solution. With this difference multiply the number of Cc. of the stronger solution required for the same purpose. The product shows the number of Cc. of the *stronger solution* needed for the mixture.

[1] Assumed to consist of equal parts of strychnine and brucine. Centinormal potassium hydroxide solution (in place of which centinormal sodium hydroxide solution, prepared in the same manner, may be employed) is used in the assay of Extract of Nux Vomica to neutralize the excess of decinormal sulphuric acid employed.

[2] This quantity is never directly weighed, but adjusted either by Oxalic Acid or by Iron; in calculations it is often abbreviated.

Next deduct the number of Cc. of the stronger solution required to decompose 10 Cc. of decinormal oxalic acid solution from 10, and with the difference multiply the number of Cc. of the weaker solution required for the same purpose. The product shows the number of Cc. of the *weaker solution* needed for the mixture.

Or, designating by S the number of Cc. of the stronger solution, and by W the number of Cc. of the weaker solution required to decompose 10 Cc. of decinormal oxalic acid solution, the following formula will give the proportions in which the solutions must be mixed:

Stronger Solution: Weaker Solution:
$$(W - 10)\ S \quad + \quad (10 - S)\ W$$

EXAMPLE.—Assuming that 9 Cc. of the stronger (S) and 10.5 of the weaker (W) solution had been required, then, substituting these values in the above-given formula, we obtain:

$$(10.5 - 10)\ 9 + (10 - 9)\ 10.5$$
$$\text{or, } 4.5 \quad + 10.5$$

making 15 Cc. of final solution.

The bulk of the two solutions is now mixed in the same proportion, 450 Cc. of the stronger and 1050 Cc. of the weaker, or 900 Cc. of the stronger and 2100 Cc. of the weaker solution.

After the mixture is thus prepared, a new trial should be made, when 10 Cc. of the solution should exactly decompose 10 Cc. of the decinormal oxalic acid solution. If necessary, a new adjustment should be made to render the correspondence perfect.

This solution should be kept in small, dark-amber-colored and glass-stoppered bottles (or in bottles provided with tubes, especially designed for the purpose). Thus prepared, this solution will hold its *titer* for months; yet it should be tested occasionally, and, when it is found reduced, the liquid should be brought back to normal strength by the addition of such an amount of the stronger solution as may be determined in the manner above described.

II. When potassium permanganate solution is to be prepared for immediate use, this may be done in the following manner: Dissolve 3.5 Gm. of pure, crystallized potassium permanganate in 1000 Cc. of pure water, recently boiled and cooled. Introduce 10 Cc. of decinormal oxalic acid solution into a beaker, add 1 Cc. of pure concentrated sulphuric acid, and proceed as directed above for the weaker permanganate solution. Note the number of Cc. of the solution consumed, and then dilute the remainder with pure water recently boiled and cooled, until 50 Cc. will exactly correspond to 50 Cc. of decinormal oxalic acid solution.

EXAMPLE.—Assuming that 9.1 Cc. of the permanganate solution first prepared had been required to produce a permanent pink tint, then every 9.1 Cc. of the solution must be diluted to 10 Cc., or the whole of the remaining solution in the same proportion. A new trial should then be made to verify the agreement.

NOTE.—Potassium permanganate solution thus prepared is liable to deteriorate more readily and quickly than that prepared by the preceding method.

One Cubic Centimeter of Decinormal Potassium Permanganate Solution is the equivalent of:

	Gramme.

Centinormal Potassium Permanganate Volumetric Solution, U. S.

$2KMnO_4 = 315.34$. 0.31534 Gm. in 1 Liter.

Dilute 10 Cc. of the decinormal potassium permanganate solution, after having ascertained that it possesses its exact titer, with enough distilled water, strictly complying with the tests given in the text of the Pharmacopœia for *Aqua Destillata*, to make 100 Cc.

This solution should be freshly made when required.

One Cubic Centimeter of Centinormal Potassium Permanganate Solution is the equivalent of:

	Gramme.
Potassium Permanganate, $KMnO_4$	0.00031534
Oxalic Acid, crystallized, $H_2C_2O_4 + 2H_2O$	0.0006285
Oxygen (derived from the permanganate) available for oxidation	0.0000798

Decinormal Potassium Sulphocyanate Volumetric Solution, U. S.

[VOLHARD'S SOLUTION.]

$KSCN = 96.99$. 9.699 Gm. in 1 Liter.

Dissolve 10 Gm. of crystals of pure potassium sulphocyanate in 1000 Cc. of water. This solution is yet too concentrated, and has to be adjusted so as to correspond in strength exactly with decinormal

silver nitrate solution. For this purpose, introduce into a flask 10 Cc. of decinormal silver nitrate solution, together with 0.5 Cc. of ferric ammonium sulphate test-solution and 5 Cc. of diluted nitric acid. To this mixture add, from a burette, in small portions at a time, the sulphocyanate solution. At first a white precipitate of silver sulphocyanate appears, then every drop falling from the burette is surrounded by a deep brownish-red color of ferric sulphocyanate, which disappears on vigorous shaking of the flask as long as any of the silver nitrate remains unchanged. When all the silver has been converted into sulphocyanate, a single additional drop of the potassium sulphocyanate solution produces a brownish-red color which no longer disappears on shaking, but communicates a perceptible pale brownish or reddish tint to the contents of the flask. Note the number of Cc. of the potassium sulphocyanate solution used, and dilute the whole of the remaining solution so that equal volumes of this and of the decinormal silver nitrate solution will be required to produce the permanent brownish or reddish tint. (The same depth of pale brownish or reddish tint to which the volumetric solution is adjusted must be attained when the solution is used for volumetric assays.)

After the dilution, a new trial should be made, in which 50 Cc. of decinormal silver nitrate solution, 2.5 Cc. of ferric ammonium sulphate test-solution, and 25 Cc. of diluted nitric acid are used, and there should be required exactly 50 Cc. of the sulphocyanate solution to produce the same depth of a permanent pale brownish or reddish tint. If necessary, a new adjustment should be made, to render the correspondence perfect.

One Cubic Centimeter of Decinormal Potassium Sulphocyanate Solution is the equivalent of:

	Gramme.
Potassium Sulphocyanate, KSCN	0.009699
Silver, Ag	0.010766
Silver Nitrate, $AgNO_3$	0.016955

The following articles are tested with this solution: Ferri Iodidum Saccharatum, Syrupus Ferri Iodidi.

Decinormal Silver Nitrate Volumetric Solution, U. S.

$AgNO_3 = 169.55$. 16.955 Gm. in 1 Liter.

Dissolve 16.955 Gm. of pure silver nitrate in enough water to make, at or near 15° C. (59° F.), exactly 1000 Cc. Keep the solution in small, dark-amber-colored, glass-stoppered vials, carefully protected against the access of dust.

NOTE.—Titration by decinormal silver nitrate solution may be managed in various ways, adapted to the special preparation to be tested:

a. In most cases it is directed by the U. S. P. to be used in presence of a small quantity of potassium chromate test-solution, which serves to indicate the end of the reaction by the appearance of the red color of silver chromate.

b. In some cases (potassium cyanide, hydrocyanic acid) it is added until the first appearance of a permanent precipitate.

c. It may be used in *all* cases without indicator by observing the exact point when no further precipitate occurs. This may be practised in the case of ferrous iodide, where the addition of potassium chromate would be improper, but it consumes much time in waiting for the precipitate to subside so as to render the liquid sufficiently clear to recognize whether a further precipitate is produced by addition of the silver solution.

d. It may be added in definite amount, known to be in excess of the quantity required, and the excess of the decinormal silver solution measured back by the addition of decinormal potassium sulphocyanate solution (residual titration).

Decinormal Sodium Chloride Volumetric Solution, U. S.

$NaCl = 58.37$. 5.837 Gm. in 1 Liter.

Dissolve 5.837 Gm. of pure sodium chloride in enough water to make, at or near 15° C. (59° F.), exactly 1000 Cc.

Pure Sodium Chloride may be prepared by passing a current of dry hydrochloric acid gas into a saturated aqueous solution of the purest commercial sodium chloride, separating the crystalline precipitate, and drying it at a temperature sufficiently high to expel all traces of free acid. In place of this, transparent crystals of pure rock-salt may be employed.

One Cubic Centimeter of Decinormal Sodium Chloride Solution is the equivalent of:

	Gramme.
Sodium Chloride, NaCl	0.005837
Silver, Ag	0.010766
Silver Nitrate, $AgNO_3$	0.016955
Silver Oxide, Ag_2O	0.011564

The following articles are tested with this solution: Argenti Nitras, Argenti Nitras Dilutus, Argenti Nitras Fusus.

Normal Sodium Hydroxide Volumetric Solution, U. S.

$NaOH = 39.96$. 39.96 Gm. in 1 Liter.

Dissolve 51 Gm. of sodium hydroxide (*Soda*, U. S. P.) in enough water to make, at or near 15° C. (59° F.), about 1050 Cc., and fill a burette with a portion of this liquid.

Put 0.6285 Gm. of pure oxalic acid into a flask of the capacity of about 100 Cc., and dissolve it with about 10 Cc. of water. Add a few drops of phenolphtalein test-solution, and then carefully add from the burette the sodium hydroxide solution, frequently agitating the flask and regulating the flow to drops toward the end of the operation, until the red color produced by its influx no longer disappears on shaking, but is not deeper than pale pink. Note the number of Cc. of the sodium hydroxide solution consumed, and then dilute the remainder of it so that exactly 10 Cc. of the diluted liquid will be required to neutralize 0.6285 Gm. of oxalic acid.

EXAMPLE.—Assuming that 7.8 Cc. of the stronger solution of sodium hydroxide first prepared had been consumed in the trial, then each 7.8 Cc. must be diluted to 10 Cc., or the whole of the remaining solution in the same proportion. Thus, if 980 Cc. should be still remaining, this must be diluted with water to 1258 Cc.

After the liquid is thus diluted a new trial should be made in the manner above described, in which 10 Cc. of the diluted solution should exactly neutralize 0.6285 Gm. of oxalic acid. If necessary, a new adjustment should then be made to render the correspondence perfect.

NOTE.—The same precautions should be taken for protecting this solution from the carbon dioxide of the air as are prescribed for normal potassium hydroxide solution.

This solution may be employed in place of the normal potassium hydroxide solution, volume for volume.

Decinormal Sodium Thiosulphate (Hyposulphite) Volumetric Solution, U. S.

$Na_2S_2O_3.5H_2O = 247.64$. 24.764 Gm. in 1 Liter.

Dissolve 30 Gm. of selected crystals of sodium thiosulphate (sodium hyposulphite) in enough water to make, at or near 15° C. (59° F.), 1100 Cc. Of this solution transfer 10 Cc. into a flask, add a few drops of starch test-solution, and then gradually add from a burette decinormal iodine solution in small portions at a time, shaking the flask after each addition, and regulating the flow to drops toward the end of the operation. As soon as the color produced by the influx of the iodine solution no longer disappears on shaking, but is not deeper than very pale blue, note the number of Cc. of the iodine solution consumed. Then dilute the sodium thiosulphate solution so that equal volumes of it and of decinormal iodine solution will exactly correspond to each other under the conditions mentioned above.

EXAMPLE.—Assuming that 10 Cc. of the stronger sodium thiosulphate solution first prepared had required 10.7 Cc. of decinormal iodine solution to produce a faint reaction with starch, the thiosulphate solution must be diluted in the proportion of 10 Cc. to 10.7 Cc., or 1000 Cc. to 1070 Cc.

After the solution is thus diluted a new trial should be made in the manner above described, in which 50 Cc. of the decinormal sodium thiosulphate solution should require exactly 50 Cc. of decinormal iodine solution to produce a faint reaction with starch. If necessary, a new adjustment should then be made to render the correspondence perfect.

Keep the solution in small, dark-amber-colored, glass-stoppered bottles, carefully protected against the access of dust.

NOTE.—When this solution is to be used, fill a burette with it, place the liquid to be tested either for the free iodine it already contains or for that which it liberates from an excess of potassium iodide added to it into a flask, and gradually add small portions of the solution from the burette, shaking after each addition, and regulating the flow to drops toward the end of the operation until the brown color of the iodine has nearly disappeared. Now add a few drops of starch test-solution, which will produce a blue color, and then continue to add the thiosulphate solution in drops until the blue tint is exactly discharged.

One Cubic Centimeter of Decinormal Sodium Thiosulphate Solution is the equivalent of:

	Gramme.
Sodium Thiosulphate (Hyposulphite), $Na_2S_2O_3 + 5H_2O$	0.024764
Bromine, Br	0.007976
Chlorine, Cl	0.003537
Iodine, I	0.012653
Iron, Fe, in ferric salts	0.005588

The following articles are tested with this solution: Aqua Chlori, Calx Chlorata, Ferri Chloridum, Ferri Citras, Ferri et Ammonii Citras, Ferri et Ammonii Sulphas, Ferri et Ammonii Tartras, Ferri et Potassii Tartras, Ferri et Quininæ Citras, Ferri et Quininæ Citras Solubilis, Ferri et Strychninæ Citras, Ferri Phosphas Solubilis, Ferri Pyrophosphas Solubilis, Ferri Valerianas, Ferrum Reductum, Iodum, Liquor

Ferri Acetatis, Liquor Ferri Chloridi, Liquor Ferri Citratis, Liquor Ferri Nitratis, Liquor Ferri Subsulphatis, Liquor Ferri Tersulphatis, Liquor Iodi Compositus, Liquor Sodæ Chloratæ, Tinctura Ferri Chloridi, Tinctura Iodi.

Normal Sulphuric Acid.

$H_2SO_4 = 97.82$. 48.91 Gm. in 1 Liter.

Carefully mix 30 Cc. of pure, concentrated sulphuric acid (of specific gravity 1.835) with enough water to make about 1050 Cc., and allow the liquid to cool to about 15° C. (59° F.). Place 10 Cc. of this liquid (which is yet too concentrated) into a flask, add a few drops of phenolphtalein test-solution, and afterward, from a burette, normal potassium hydroxide solution, shaking after each addition, and regulating the flow to drops toward the end of the operation, until the red color produced by its influx no longer disappears on shaking, but is not deeper than pale pink. Note the number of Cc. of potassium hydroxide solution consumed. Then dilute the sulphuric acid solution so that equal volumes of this and of normal potassium hydroxide solution exactly neutralize each other.

EXAMPLE.—Assuming that 10 Cc. of the acid solution first prepared had required exactly 11.2 Cc. of normal potassium hydroxide solution, each 10 Cc. of the former must be diluted to 11.2 Cc., or each 1000 Cc. to 1120 Cc. After the liquid is thus diluted a new trial should be made in the manner above described, in which 50 Cc. of the acid solution should require for neutralization exactly 50 Cc. of potassium hydroxide solution. If necessary, a new adjustment should be made to render the correspondence perfect.

NOTE.—It is recommended that in alkalimetric determinations, when an acid of normal strength is required, normal sulphuric acid be employed in place of normal oxalic acid solution.

One Cubic Centimeter of Normal Sulphuric Acid is the equivalent of:

Decinormal Sulphuric Acid, U. S.

$H_2SO_4 = 97.82$. 4.891 Gm. in 1 Liter.

Dilute 10 Cc. of normal sulphuric acid with enough water to make 100 Cc.

One Cubic Centimeter of Decinormal Sulphuric Acid is the equivalent of:

	Gramme.
Sulphuric Acid, absolute, H_2SO_4	0.004891
Combined Alkaloids of Nux Vomica, assumed to consist of equal parts of Strychnine and Brucine	0.0364
Potassium Hydroxide, KOH	0.005599

The following article is tested with this solution: Extractum Nucis Vomicæ.

4. Gasometric Estimations.

In certain cases the Pharmacopœia directs the strength of a product or chemical substance to be determined by the volume of some gas (nitrogen dioxide) given off during a definite reaction. This volume is to be determined by the nitrometer in the following manner:

Arrange a nitrometer consisting of a measuring tube (graduated for at least 50 Cc.) and connected by stout rubber tubing with an open equilibrium-tube (both tubes, preferably, provided with a globular expansion near the lower end) in such a manner, by suitable clamps attached to

a stand, that either tube may be readily and quickly clamped at a higher or lower level. The stopcock of the measuring tube having been opened, and the open equilibrium-tube having been raised to a higher level, pour into the latter a saturated aqueous solution of sodium chloride until the measuring tube, including the bore of the stopcock, is completely filled. Then close the latter and fix the equilibrium-tube at a low level. Having ascertained that the stopcock is closed air-tight, and having, if necessary, wiped out the graduated funnel-tube of the nitrometer, introduce into it the prescribed quantity of the liquid to be tested, and allow this to flow slowly into the measuring tube, being careful not to admit any air. Follow it by the prescribed quantities of the several reagents (potassium iodide test-solution and normal sulphuric acid). When the reaction, which takes place at once, moderates, remove the measuring tube from its clamp, and, being careful to hold it constantly so that the liquid contained in it stands at a higher level than that in the equilibrium-tube, shake its contents, without permitting any gas to pass into the open tube. When the reaction has completely ceased restore the tube to its fastening, and allow the apparatus and contents to acquire the ordinary temperature of the room, which is assumed to be at or about 25° C. (77° F.). Then adjust the two tubes so that the liquid columns are exactly the same level, and read off the volume of gas in the measuring tube. Multiply this figure by the weight of the substance yielding 1 Cc. of nitrogen dioxide (see below). The result will be the weight of the pure substance (nitrite) contained in the amount taken for the assay.

For pharmacopœial purposes the determination will be sufficiently exact if the evolved gas be measured at or near 25° C. (77° F.). If it be desired to ascertain the volume which the gas would occupy at any other temperature between 0° C. and 40° C. (32°–104° F.), this may be done with the aid of the table below printed.

EXAMPLE.—Assuming that the volume of gas read off was 44.5 Cc. at 27° C. (80.6° F.), and that it be desired to ascertain the corresponding volume at 0° C. (32° F.), barometric pressure not being taken into consideration, then the 44.5 Cc. must be reduced in the proportion of 1.098901 to 1; or 44.5 must be divided by 1.098901. The result will be 40.5 Cc.

The following table shows the expansion which 1 Cc. of a gas will undergo when it is raised from 0° C. (32° F.) to 40° C. (104° F.):

EXPANSION OF 1 CC. OF A GAS BETWEEN 0° AND 40° C.

°C.	Cc.	°C.	Cc.	°C.	Cc.
0	1.000000	14	1.051282	28	1.102564
1	1.003663	15	1.054945	29	1.106227
2	1.007326	16	1.058608	30	1.109890
3	1.010989	17	1.062271	31	1.113553
4	1.014652	18	1.065934	32	1.117216
5	1.018315	19	1.069597	33	1.120879
6	1.021978	20	1.073260	34	1.124542

Estimation of Nitrogen Dioxide.

NO = 29.97; 1 Liter { at 0° C. and 760 Mm. = 1.3423 Gm.
at 25° C. and 760 Mm. = 1.2297 Gm.

One Cubic Centimeter of Nitrogen Dioxide is the equivalent of:

	At 0° C. and 760 Mm. Gramme.	At 25° C. and 760 Mm. Gramme.
Nitrogen Dioxide, NO	0.0013423	0.0012297
Amyl Nitrite, $C_5H_{11}NO_2$	0.0052305	0.0047923
Ethyl Nitrite, $C_2H_5NO_2$	0.0033529	0.0030716
Sodium Nitrite, $NaNO_2$	0.0030873	0.0028283

The following articles are tested gasometrically by the volume of Nitrogen Dioxide evolved and measured at or near 25° C. (77° F.): Amyl Nitris, Sodii Nitris, Spiritus Ætheris Nitrosi.

Alphabetical List of Volumetric Assays directed by the U. S. Pharmacopœia.

Name.	Gm. taken.	Cc. required.	Volumetric Solution.	Indicator.	Percentage of Strength.	
Acidum Aceticum	6.0	36.0	Normal KOH	Phenolphtalein	36	of absolute acid.
Acidum Aceticum Dilutum	24.0	24.0	Normal KOH	Phenolphtalein	6	of absolute acid.
Acidum Aceticum Glaciale	3.0	49.5	Normal KOH	Phenolphtalein	99	of absolute acid.
Acidum Arsenosum	0.1	20.0	Decinormal Iodine	Starch	98.8	of As_2O_3.
Acidum Carbolicum	0.039	24.0	Decinormal Bromine*		96	of pure phenol.
Acidum Citricum	3.5	50.0	Normal KOH	Phenolphtalein	100	of pure acid.
Acidum Hydrobromicum Dilutum	8.08	10.0	Normal KOH	Phenolphtalein	10	of absolute acid.
Acidum Hydrochloricum	3.64	31.9	Normal KOH	Phenolphtalein	31.9	of absolute acid.
Acidum Hydrochloricum Dilutum	3.64	10.0	Normal KOH	Phenolphtalein	10	of absolute acid.
Acidum Hydrocyanicum Dilutum	1.35	10.0	Decinormal $AgNO_3$	K_2CrO_4	2	of absolute acid.
Acidum Hypophosphorosum Dilutum	0.5	★30.3	Decinormal $KMnO_4$		★10	of absolute acid.
	6.6	★10.0	Normal KOH	Phenolphtalein	★10	of absolute acid.
Acidum Lacticum	4.5	37.5	Normal KOH	Phenolphtalein	75	of absolute acid.
Acidum Nitricum	3.145	34.0	Normal KOH	Phenolphtalein	68	of absolute acid.
Acidum Nitricum Dilutum	6.29	10.0	Normal KOH	Phenolphtalein	10	of absolute acid.
Acidum Phosphoricum	0.978	17.0	Normal KOH	Phenolphtalein	85	of absolute acid.
	0.978	8.5	Normal KOH	Methyl-Orange	85	of absolute acid.
Acidum Phosphoricum Dilutum	4.89	10.0	Normal KOH	Phenolphtalein	10	of absolute acid.
	4.89	5.0	Normal KOH	Methyl-Orange	10	of absolute acid.
Acidum Sulphuricum	0.489	9.25	Normal KOH	Phenolphtalein	92.5	of absolute acid.
Acidum Sulphuricum Aromaticum	4.89	★18.5	Normal KOH	Phenolphtalein	★18.5	of absolute acid.
Acidum Sulphuricum Dilutum	4.89	10.0	Normal KOH	Phenolphtalein	10	of absolute acid.
Acidum Sulphurosum	2.0	40.0	Decinormal Iodine	Starch	6.4	of SO_2.
Acidum Tartaricum	3.75	50.0	Normal KOH	Phenolphtalein	100	of pure acid.
Ammonii Bromidum	0.3	30.9	Decinormal $AgNO_3$	K_2CrO_4	99	of NH_4Br.
Ammonii Carbonas	2.613	50.0	Normal H_2SO_4	Rosolic Acid	100	of pure salt.
Antimonii et Potassii Tartras	0.331	20.0	Decinormal Iodine	Starch	100	of pure salt.
Aqua Ammoniæ	3.4	20.0	Normal H_2SO_4	Rosolic Acid	10	of NH_3.
Aqua Ammoniæ Fortior	1.7	28.0	Normal H_2SO_4	Rosolic Acid	28	of NH_3.
Aqua Chlori	17.7	20.0	Decinormal $Na_2S_2O_3$	Starch	0.4	of chlorine.
Aqua Hydrogenii Dioxidi	1.7 Cc.	30.0	Decinormal $KMnO_4$		3	of H_2O_2.
Argenti Nitras	0.34	20.0	Decinormal NaCl	K_2CrO_4	99.97	of $AgNO_3$.
Argenti Nitras Dilutus	1.0	19.5	Decinormal NaCl	K_2CrO_4	33.14	of $AgNO_3$.
Argenti Nitras Fusus	0.34	19.0	Decinormal NaCl	K_2CrO_4	95	of $AgNO_3$.
Barii Dioxidum	0.422	40.0	Decinormal $KMnO_4$		80	of pure BaO_2.
Calcii Bromidum	0.25	25.0	Decinormal $AgNO_3$	K_2CrO_4	99.7	of pure salt.
Calcii Hypophosphis	0.1	47.0	Decinormal $KMnO_4$		99.68	of pure salt.
Calx Chlorata	0.354	35.0	Decinormal $Na_2S_2O_3$	Starch	35	of chlorine.
Extractum Nucis Vomicæ	0.4	1.65	Decinormal H_2SO_4	Phenolphtalein	15	of total alkaloids.
Ferri Carbonas Saccharatus	3.47	★15.0	Decinormal $K_2Cr_2O_7$	Ferricyanide	★15	of $FeCO_3$.

★ About.

* Determined by residual titration with decinormal sodium thiosulphate solution.

Ferri Carbonas Saccharatus	1.16	★15.0	Decinormal $KMnO_4$	★15	of $FeCO_3$.

Note.—On page 1041 will be found complete Saturation Tables, showing the quantity of official alkalies required to saturate 100 parts of an official acid.

Table of Elements.

The atomic weights, as determined by L. Meyer and K. Seubert, are those adopted by the U. S. Pharmacopœia.

	Symbols.	Atomic value.	Atomic weight.		Symbols.	Atomic value.	Atomic weight.
Aluminum	Al	III	27.04	Mercury (Hydrargyrum)	Hg	II	199.8
Antimony (Stibium)	Sb	III, V	119.6	Molybdenum	Mo	II, IV, VI	95.9
Arsenic	As	III, V	74.9	Nickel	Ni	II, VI	58.6
Barium	Ba	II, IV	136.9	Nitrogen	N	I, III, V	14.01
Beryllium (Glucinum)	Be	II	9.03	Osmium	Os	II, IV, VI, VIII	190.3
Bismuth	Bi	III, V	208.9	Oxygen	O	II	15.96
Boron	B	III	10.9	Palladium	Pd	II, IV	106.35
Bromine	Br	I, III, V, VII	79.76	Phosphorus	P	III, V	30.96
Cadmium	Cd	II	111.5	Platinum	Pt	II, IV	194.3
Cæsium	Cs	I	132.7	Potassium (Kalium)	K	I	39.03
Calcium	Ca	II	39.91	Rhodium	Rh	II, III, IV	102.9
Carbon	C	II, IV	11.97	Rubidium	Rb	I	85.2
Cerium	Ce	III, IV	139.9	Ruthenium	Ru	II, IV, VI, VIII	101.4
Chlorine	Cl	I, III, V, VII	35.37	Samarium	Sm		149.62
Chromium	Cr	III, VI	52.0	Scandium	Se	III	43.97
Cobalt	Co	II, III, VI	58.6	Selenium	Se	II, IV, VI	78.87
Columbium (Niobium)	Cb	III, V	93.7	Silicium	Si	IV	28.3
Copper (Cuprum)	Cu	I, II	63.18	Silver (Argentum)	Ag	I	107.66
Didymium	D	III	142.0	Sodium (Natrium)	Na	I	23.0
Erbium	Eb	III	166.0	Strontium	Sr	II, IV	87.3
Fluorine	F	I	19.0	Sulphur	S	II, IV, VI	31.98
Gallium	Ga	III	69.9	Tantalum	Ta	V	182.0
Germanium	Ge	II, IV	72.3	Tellurium	Te	II, IV, VI	125.0
Gold (Aurum)	Au	I, III	196.7	Terbium	Tb		159.1
Hydrogen	H	I	1.0	Thallium	Tl	I, III	203.7
Indium	In	III	113.6	Thorium	Th	IV	231.9
Iodine	I	I, III, V, VII	126.53	Tin (Stannum)	Sn	II, IV	118.8
Iridium	Ir	II, IV, VI	192.5	Titanium	Ti	IV	48.0
Iron (Ferrum)	Fe	II, III, VI	55.88	Tungsten or Wolfram	W	II, IV, VI	183.6
Lanthanum	La	III	138.2	Uranium	U	IV, VI	238.8
Lead (Plumbum)	Pb	II, IV	206.4	Vanadium	V	III, V	51.1
Lithium	Li	I	7.01	Ytterbium	Yb	III	172 6
Magnesium	Mg	II	24.3	Yttrium	Y	III	88.9
Manganese	Mn	II, IV, VI	54.8	Zinc	Zn	II	65.1
				Zirconium	Zr	IV	90.4

In addition to the above, the discovery of the following elements has been announced, but little is known of their properties: Actinium (Ac), Decipium (Dp), Holmium (Ho), Ilmenium (Il), Lavœsium (Lv), Mosandrium (Mo), Neptunium (Np), Philippium (Pp), and Thulium (Tu).

Equivalents of Weights and Measures, U. S. P.

Customary and Metric.

The values given in the following tables for the relation of weight to measure apply to water at its greatest density (temperature 4° C. or 39.2° F.) *in vacuo*, and for ordinary purposes may be used without correction. If intended to be applied to liquids having a higher or lower specific gravity than water, the weight in grammes of such liquid must be divided by the specific gravity of the liquid in order to ascertain the volume in cubic centimeters corresponding to the given weight; the customary fluid measure can then be found by reference to the tables. For instance, to find the volume in fluidounces of 875 grammes of official alcohol, divide 875 by 0.820, which yields 1067.07 cubic centimeters, and 1067.07 Cc. of water at 4° C. equal 36.082 fluidounces, for 1000 : 33.814 : : 1067.07 : *x*. $x = 36.082$; hence 875 Gm. of alcohol U. S. P. measure practically 36.082 fluidounces.

Tables of Weights and Measures.

Apothecaries' or Troy Weight, U. S.

One pound,	℔	= 12 troyounces	= 5760 grains	= 13 ounces avoirdupois 72.5 grains.
One troyounce,	℥	= 8 drachms	= 480 "	= 1 ounce " 42.5 "
One drachm,	ʒ	= 3 scruples	= 60 "	
One scruple,	℈		= 20 "	
One grain,	gr.		= 1 grain.	

Apothecaries' or Wine Measure, U. S.

					Cubic inches.	Troy grains of water at 60° F.
1 minim, ♏					0.00376	0.95
60 minims =	1 fluidrachm, ʒ				0.2256	56.96
480 " =	8 fluidrachms =	1 fluidounce, f ℥			1.8047	455.69
7680 " =	128 " =	16 fluidounces =	1 pint, O		28.875	7291.11
61440 " =	1024 " =	128 " =	8 pts. =	1 gal., Cong. 231.		58328.88

Weights and Measures of the British Pharmacopœia.

One pound,	lb	= 16 ounces	= 7000 troy grains	= lbi ℥ij ʒiv gr. xl.
One ounce,	oz.	= 437.5 "	= ℥ vij gr. xvijss.
One grain,	gr.	= 1 grain.	

The pound and ounce of the British Pharmacopœia are identical with the same denominations of *avoirdupois weight*. The avoirdupois ounce is subdivided into 16 drachms (1 drachm = 27.34 troy grains); but the British Pharmacopœia recognizes no subdivisions between the ounce and grain. It is, however, optional with the physician *in prescribing* to use the symbols ℈ and ʒ, the former representing 20 and the latter 60 grains, if such be found to conduce to accuracy or convenience.

						Troy grains.	Avoirdupois.

				Wine measure.
1 liter (or 1 cubic decimeter)				1.0567 quarts.
10 liters =	1 dekaliter			2.6417 gallons.
100 " =	10 dekaliters =	1 hektoliter		26.417 "
1000 " =	100 " =	10 hektoliters =	1 kiloliter or stere	264.17 "

The unit of all metric measures is the *meter* (French, *mètre*), and this is the ten-millionth part of the quadrant or fourth part of the terrestrial meridian, the quadrant being the distance from the equator to the pole. The cube of the tenth part of a meter, denominated *liter* (Fr. *litre*), was adopted as the unit of measures of capacity. The weight of the one-thousandth part of a liter of distilled water at its greatest density (4° C.) was denominated *gram* (Fr. *gramme*), and adopted as the unit of weight. The subdivisions of all measures are named by prefixing to the name of the unit the Latin numerals *deci* (.1), *centi* (.01), and *milli* (.001), and the larger denominations by prefixing the Greek numerals *deka* (10), *hekto* (100), *kilo* (1000), and *myria* (10000).

Relative Value of Wine or Apothecaries' and Imperial Measures.

Wine measure.	Imperial measure. Pints.	Floz.	Fldr.	Minims.	Imperial measure.	Wine measure. Galls.	Pints.	f3.	f3.	Minims.
1 minim	...	...	...	1.04	1 minim	...	...	...	...	0.96
1 fluidrachm	...	...	1	2.5	1 fluidrachm	...	...	...	...	58

1 pint	...	16	5	19.	1 pint	...	1	3	1	38
1 gallon	6	13	2	32.	1 gallon	1	1	9	5	4

24 fluidounces wine measure = 25 fluidounces Imperial measure (difference 1 grain).

Approximate Measures.

In Great Britain prescriptions are compounded by weighing the solids and measuring the liquids, and the same course is very generally followed in the United States; but on the continent of Europe weights alone are employed in the making of preparations as well as in the compounding of prescriptions. Medicines are, however, taken by familiar domestic measures, which are subject to considerable variations, but are usually estimated as having the following capacity:

	In the United States.	In France.
A teaspoonful	1 fluidrachm	5 grams of water.
A desertspoonful	2 fluidrachms	10 " " "
A tablespoonful	½ fluidounce	15 " " "
A wineglassful	2 fluidounces	———
A glassful	———	150 grams of water.
A teacupful	4 fluidounces	———
A tumblerful	8 fluidounces	———

The approximate measures by the *handful* (Fr. *poignée*) and pinch (Fr. *pincée*) are almost completely discarded, or employed only for the least active drugs.

The measuring of small quantities of liquids by drops gives very uncertain and variable results, which are influenced by the viscidity of the liquid, the size, shape, and fulness of the vessel, the curvature of the lip, the temperature, the rapidity of dropping, and probably by other circumstances. As a rule, it may be said that aqueous liquids yield larger drops than those containing little or no water; but very different results are obtained with the same liquid dropped from different bottles, or even from the same bottle under different conditions; the differences amount frequently to 50, and occasionally to 200, per cent. For these reasons medicated liquids should not be ordered in drops, but preferably by weight or measure; and whenever it is desirable for the patient to take a medicine by drops, the dose may be approximated by estimating each minim to contain of—

Ether and ethereal solutions	2½ to 3 drops.
Tinctures, alcoholic solutions, and volatile oils	1½ to 2 or 2½ drops.
Medicated wines	1 to 1½ drops.
Water and aqueous solutions	¾ to 1 drop.

In order to avoid to some extent the discrepancies resulting from the dropping of liquids under various conditions, dropping-measures (*compte-gouttes*) have been constructed in France, yielding at 15° C. drops of distilled water, 20 of which weigh 1 Gm., at least within a limit of 2 per cent. The French Codex gives a table containing the weight of 1 drop, and the number of drops for 1 Gm. of various liquids, dropped under the conditions stated, which may be summarized as follows:

Number of drops	for 1 Gm. of the following liquids:
20	Hydrocyanic acid, Diluted sulphuric acid, Aqueous solutions of the salts of metals and the alkaloids.
21–26	Mineral acids, Ammonia-water, Glycerin, Fowler's solution, Vinegars.
31	Solution of chloral (¼).
33	Wine (Grenache) and medicated wines.
43	Creasote.
48	Fixed oils.
50–57	Glacial acetic acid, Carbolic acid (alcoholic solution), Alcohol (sp. gr. .864 and over), Chloroform, Volatile oils, Tinctures, Spirit of nitrous ether.
61	Alcohol (sp. gr. .834), Tincture of iodine.
72	Spirit of ether.
90	Ether.

TABLE SHOWING THE RELATION OF THE DEGREES OF BAUME'S HYDROMETERS TO SPECIFIC GRAVITIES.

The hydrometers most frequently used in the United States are those constructed upon the plan of Baumé. For liquids *heavier* than water the point to which the instrument sinks in pure water is 0, and the point to which it sinks in a solution of 15 parts of dry table-salt in 85 parts of water is marked 15, the distance between the two points being divided into 15 equal parts, and the scale continued with divisions of the same size. For liquids *lighter* than water the instrument is floated in a solution of 10 parts of dry table-salt in 90 parts of water, and afterward in pure water, the distance being divided into 10 equal parts, and the scale continued in like manner; the point indicating the density of water is marked 10. The hydrometers were originally constructed at a *medium* temperature. In the United States they are made for the temperature of 60° F. (15.55° C.), and the scales as originally published by Henry Pemberton (1852) are recognized. They agree closely with the determinations made by Schober and Pescher for liquids heavier than water, and differ but little for liquids lighter than water.

Cartier's hydrometer, which is occasionally employed in France, agrees with Baumé's scale for liquids lighter than water, except that 16° of the latter are equal to 15° Cartier.

For Liquids Heavier than Water.

ALPHABETICAL LIST OF OFFICIAL DRUGS

SHOWING THE PREPARATIONS OF THE U. S. AND BR. PHARMACOPŒIAS CONTAINING THEM.

Acaciæ.
- Emulsum Amygdalæ, *U. S.*
- Mistura Amygdalæ, *Br.*
  - Cretæ, *U. S., Br.*
  - Glycyrrhizæ Composita, *U. S.*
  - Guaiaci, *Br.*
- Mucilago Acaciæ, *U. S., Br.*
- Pulvis Amygdalæ Compositus, *Br.*
  - Cretæ Compositus, *U. S.*
  - Tragacanthæ Compositus, *Br.*
- Syrupus Acaciæ, *U. S., Br.*
- Trochisci, *U. S., Br.*

Acidum Aceticum.
- Acetum Cantharidis, *Br.*
  - Opii, *U. S.*
  - Scillæ, *U. S., Br.*
- Acidum Aceticum Dilutum, *U. S., Br.*
- Emplastrum Ammoniaci cum Hydrargyro, *U. S.*
- Extractum Colchici Aceticum, *U. S., Br.*
  - Conii, *U. S.*
    - Fluidum, *U. S.*
  - Ergotæ Fluidum, *U. S.*
  - Nucis Vomicæ, *U. S.*
    - Fluidum, *U. S.*
  - Sanguinariæ Fluidum, *U. S.*
- Liquor Ammonii Acetatis, *U. S.*
  - Fortior, *Br.*
  - Ferri et Ammonii Acetatis, *U. S.*
  - Morphinæ Acetatis, *Br.*
- Oxymel, *Br.*
  - Scillæ, *Br.*
- Syrupus Allii, *U. S.*
  - Scillæ, *U. S., Br.*
- Tinctura Ferri Acetatis, *Br.*
  - Sanguinariæ, *U. S.*

Acidum Aceticum Glaciale.
- Acetum Cantharidis, *Br.*
- Linimentum Terebinthinæ Aceticum, *Br.*
- Liquor Ferri Acetatis, *U. S.*
- Mistura Creasoti, *Br.*

Acidum Arsenosum.
- Liquor Acidi Arsenosi, *U. S.*
  - Arsenicalis, *Br.*
  - Arsenici Hydrochloricus, *Br.*
  - Potassii Arsenitis, *U. S.*

Acidum Benzoicum.
- Tinctura Camphoræ Composita, *Br.*
  - Opii Ammoniata, *Br.*
    - Camphorata, *U. S.*
- Trochisci Acidi Benzoici, *Br.*

Acidum Boricum.
- Glyceritum Boroglycerini, *U. S.*
- Unguentum Acidi Borici, *Br.*

Acidum Carbolicum.
- Acidum Carbolicum Liquefactum, *Br.*
- Glyceritum Acidi Carbolici, *U. S., Br.*
- Suppositoria Acidi Carbolici cum Sapone, *Br.*
- Unguentum Acidi Carbolici, *U. S., Br.*

Acidum Chromicum.
- Liquor Acidi Chromici, *Br.*

Acidum Citricum.
- Bismuthi Citras, *U. S., Br.*
- Ferri et Quininæ Citras, *U. S., Br.*
  - Solubilis, *U. S.*
- Strychninæ Citras, *U. S.*
- Liquor Ferri Citratis, *U. S.*
  - Magnesii Citratis, *U. S., Br.*
  - Potassii Citratis, *U. S.*
- Lithii Citras Effervescens, *U. S.*
- Magnesii Citras Effervescens, *U. S.*
- Sodii Citro-tartras Effervescens, *Br.*
- Syrupus Acidi Citrici, *U. S.*
- Vinum Quininæ, *Br.*

Acidum Gallicum.
- Glyceritum Acidi Gallici, *Br.*

Acidum Hydrochloricum.
- Acidum Hydrochloricum Dilutum, *U. S., Br.*
  - Nitrohydrochloricum, *U. S.*
    - Dilutum, *U. S., Br.*
- Liquor Antimonii Chloridi, *Br.*
  - Acidi Arsenosi, *U. S.*
  - Arsenici Hydrochloricus, *Br.*
  - Ferri Chloridi, *U. S.*
    - Perchloridi, *Br.*
  - Zinci Chloridi, *U. S., Br.*

Acidum Hydrocyanicum Dilutum.
- Tinctura Chloroformi et Morphinæ, *Br.*
- Vapor Acidi Hydrocyanici, *Br.*

Acidum Hypophosphorosum Dilutum.
- Syrupus Hypophosphitum Compositus, *U. S.*

Acidum Lacticum.
- Acidum Lacticum Dilutum, *Br.*
- Syrupus Calcii Lactophosphatis, *U. S.*

Acidum Nitricum.
- Acidum Nitricum Dilutum, *U. S., Br.*
  - Nitrohydrochloricum, *U. S.*
    - Dilutum, *U. S., Br.*
- Liquor Ferri Nitratis, *U. S.*
  - Pernitratis, *Br.*
  - Hydrargyri Nitratis Acidus, *Br.*
- Unguentum Hydrargyri Nitratis, *U. S., Br.*

Acidum Oleicum.
- Oleatum Hydrargyri, *U. S., Br.*
  - Veratrinæ, *U. S.*
  - Zinci, *U. S., Br.*

Acidum Phosphoricum.
- Acidum Phosphoricum Dilutum, *U. S., Br.*
- Syrupus Ferri Phosphatis, *Br.*
  - Quininæ et Strychninæ Phosphatum, *U. S.*

Acidum Salicylicum.
- Unguentum Acidi Salicylici, *Br.*

Acidum Stearicum.
- Suppositoria Glycerini, *U. S.*

Acidum Sulphuricum.
- Acidum Sulphuricum Aromaticum, *U. S., Br.*
  - Dilutum, *U. S., Br.*
- Infusum Cinchonæ, *U. S.*
  - Rosæ Acidum, *Br.*

Acidum Tannicum.
- Collodium Stypticum, *U. S.*
- Glyceritum Acidi Tannici, *U. S., Br.*

Acidum Tannicum.
Suppositoria Acidi Tannici, *Br.*
cum Sapone, *Br.*
Trochisci Acidi Tannici, *U. S., Br.*
Unguentum Acidi Tannici, *U. S.*

Aconitum.
Extractum Aconiti.
Fluidum.
Linimentum Aconiti, *Br.*
Tinctura Aconiti, *U. S., Br.*

Aconitina.
Unguentum Aconitinæ, *Br.*

Adeps.
Adeps Benzoinatus, *U. S., Br.*
Ceratum, *U. S.*
Camphoræ, *U. S.*
Cantharidis, *U. S.*
(Unguentum, *Br.*) Resinæ, *U. S.*
Emplastrum Resinæ, *Br.*
Unguentum, *U. S.*
Acidi Carbolici, *U. S.*
Tannici, *U. S.*
Aconitinæ, *Br.*
Antimonii Tartarati, *Br.*
Atropinæ, *Br.*
Belladonnæ, *U. S., Br.*
Calaminæ, *Br.*
Chrysarobini, *U. S., Br.*
Creasoti, *Br.*
Elemi, *Br.*
Gallæ, *U. S., Br.*
Hydrargyri, *U. S., Br.*
Ammoniati, *U. S., Br.*
Iodidi Rubri, *Br.*
Nitratis, *Br.*
Oxidi Flavi, *U. S.*
Rubri, *U. S.*
Subchloridi, *Br.*
Iodi, *U. S., Br.*
Iodoformi, *U. S., Br.*
Picis Liquidæ, *U. S.*
Plumbi Acetatis, *Br.*
Carbonatis, *U. S., Br.*
Iodidi, *U. S., Br.*
Potassii Iodidi, *U. S., Br.*
Sabinæ, *Br.*
Simplex, *Br.*
Staphisagriæ, *Br.*
Stramonii, *U. S.*
Sulphuris, *U. S., Br.*
Terebinthinæ, *Br.*
Veratrinæ, *U. S.*
Zinci Oxidi, *U. S., Br.*

Æther.
Collodium, *U. S., Br.*
Cantharidatum, *U. S.*
Flexile, *U. S., Br.*
Stypticum, *U. S.*
Oleoresinæ, *U. S., Br.*
Oleum Æthereum, *U. S.*
Phosphoratum, *U. S.*
Spiritus Ætheris, *U. S., Br.*
Compositus, *U. S., Br.*
Tinctura Chloroformi et Morphinæ, *Br.*

Æther Aceticus.
Liquor Epispasticus, *Br.*

Alcohol.
Alcohol Dilutum, *U. S.*
Spiritus Tenuior, *Br.*

Allium.
Syrupus Allii.

Aloe Barbadensis.
Enema Aloes, *Br.*
Extractum Aloes Barbadensis, *Br.*
Pilula Aloes Barbadensis, *Br.*

Aloe Barbadensis.
Pilula Aloes et Ferri, *Br.*
Cambogiæ Composita, *Br.*
Pilula Colocynthidis Composita, *Br.*
et Hyoscyami, *Br.*

Aloe Socotrina.
Aloes Purificata.
Decoctum Aloes Compositum, *Br.*
Extractum Aloes, *U. S., Br.*
Colocynthidis Compositum, *U. S., Br.*
Pilulæ Aloes, *U. S., Br.*
et Asafœtidæ, *U. S., Br.*
et Ferri, *U. S.*
et Mastiches, *U. S.*
et Myrrhæ, *U. S., Br.*
Rhei Compositæ, *U. S., Br.*
Tinctura Aloes, *U. S., Br.*
et Myrrhæ, *U. S.*
Benzoini Composita, *U. S., Br.*
Vinum Aloes, *Br.*

Althæa.
Massa Hydrargyri, *U. S.*
Pilulæ Ferri Carbonatis, *U. S.*
Phosphori, *U. S.*
Syrupus Althææ, *U. S.*

Alumen.
Alumen Exsiccatum, *U. S., Br.*
Glycerinum Aluminis, *Br.*

Ammoniacum.
Emplastrum Ammoniaci cum Hydrargyro, *U. S., Br.*
Galbani, *Br.*
Emulsum Ammoniaci, *U. S.*

Hydrargyrum Ammoniatum.
Unguentum Hydrargyri Ammoniati, *U. S., Br.*

Hydrastis.
Extractum Hydrastis Fluidum, *U. S., Br.*
Glyceritum Hydrastis, *U. S.*
Tinctura Hydrastis, *U. S., Br.*

Hyoscyamus.
Extractum Hyoscyami, *U. S., Br.*
Fluidum, *U. S.*
Pilulæ Catharticæ Vegetabiles, *U. S.*
Colocynthidis et Hyoscyami, *Br.*
Succus Hyoscyami, *Br.*
Tinctura Hyoscyami, *U. S., Br.*

Ichthyocolla.
Emplastrum Ichthyocollæ, *U. S.*

Iodoformum.
Suppositoria Iodoformi, *Br.*
Unguentum Iodoformi, *U. S., Br.*

Iodum.
Linimentum Iodi, *Br.*
Liquor Iodi, *Br.*
Compositus, *U. S.*
Sulphuris Iodidum, *U. S., Br.*
Syrupus Ferri Iodidi, *U. S., Br.*
Tinctura Iodi, *U. S., Br.*
Unguentum Iodi, *U. S., Br.*
Vapor Iodi, *Br.*

Ipecacuanha.
Extractum Ipecacuanhæ Fluidum, *U. S.*
Pilula Conii Composita, *Br.*

Ipecacuanha.
Pilula Ipecacuanhæ cum Scilla, *Br.*
Pulvis Ipecacuanhæ et Opii, *U. S.*
Compositus, *Br.*
Syrupus Ipecacuanhæ, *U. S.*
Tinctura Ipecacuanhæ et Opii, *U. S.*
Trochisci Ipecacuanhæ, *U. S., Br.*
Morphinæ et Ipecacuanhæ, *U. S., Br.*
Vinum Ipecacuanhæ, *U. S., Br.*

Iris.
Extractum Iridis, *U. S.*
Fluidum, *U. S.*

Jalapa.
Extractum Jalapæ, *U. S., Br.*
Pilula Scammonii Composita, *Br.*
Pilulæ Catharticæ Compositæ, *U. S.*
Vegetabiles, *U. S.*
Pulvis Jalapæ Compositus, *U. S., Br.*
Scammonii Compositus, *Br.*
Resina Jalapæ, *U. S., Br.*
Tinctura Jalapæ, *Br.*

Juglans.
Extractum Juglandis, *U. S.*

Kino.
Pulvis Catechu Compositus, *Br.*
Kino Compositus, *Br.*
Tinctura Kino, *U. S., Br.*

Krameria.
Extractum Krameriæ, *U. S., Br.*
Fluidum, *U. S.*
Infusum Krameriæ, *Br.*
Pulvis Catechu Compositus, *Br.*
Tinctura Krameriæ, *U. S., Br.*

Lactucarium.
Syrupus Lactucarii, *U. S.*
Tinctura Lactucarii, *U. S.*

Lappa.
Extractum Lappæ Fluidum, *U. S.*

Leptandra.
Extractum Leptandræ, *U. S.*
Fluidum, *U. S.*
Pilulæ Catharticæ Vegetabiles, *U. S.*

Limonis Cortex.
Infusum Aurantii Compositum, *Br.*
Gentianæ Compositum, *Br.*
Oleum Limonis, *U. S., Br.*
Spiritus Limonis, *U. S.*
Syrupus Limonis, *Br.*
Tinctura Limonis, *Br.*

Limonis Succus.
Syrupus Limonis, *Br.*

Linum.
Cataplasma Lini, *Br.*
Infusum Lini, *Br.*
Lini Farina, *Br.*
Oleum Lini, *U. S., Br.*

Liquor Calcis.
Linimentum Calcis, *U. S., Br.*
Lotio Hydrargyri Flava, *Br.*
Nigra, *Br.*

Liquor Ferri Chloridi.
Tinctura Ferri Chloridi, *U. S.*

Liquor Ferri Citratis.
Ferri Citras, *U. S.*
et Ammonii Citras, *U. S., Br.*

Lithii Carbonas.
Liquor Lithiæ Effervescens, *Br.*
Lithii Citras Effervescens, *U. S.*

Lobelia.
Extractum Lobeliæ Fluidum, *U. S.*
Tinctura Lobeliæ, *U. S., Br.*
Ætherea, *Br.*

Lupulinum.
Extractum Lupulini Fluidum, *U. S.*
Oleoresina Lupulini, *U. S.*

Magnesia.
Massa Copaibæ, *U. S.*
Pulvis Rhei Compositus, *U. S., Br.*
Magnesii Carbonas.
Liquor Magnesii Carbonatis, *Br.*
Citratis, *U. S., Br.*
Magnesia, *U. S., Br.*
Trochisci Bismuthi, *Br.*
Magnesii Sulphas.
Enema Magnesii Sulphatis, *Br.*
Infusum Sennæ Compositum, *U. S.*
Magnesii Sulphas Effervescens, *Br.*
Mistura Sennæ Composita, *Br.*
Manna.
Infusum Sennæ Compositum, *U. S.*
Mastiche.
Pilulæ Aloes et Mastiches, *U. S.*
Matico.
Extractum Matico Fluidum, *U. S.*
Infusum Maticæ, *Br.*
Tinctura Matico, *U. S.*
Mel.
Confectio Piperis, *Br.*
Rosæ, *U. S.*
Scammonii, *Br.*
Terebinthinæ, *Br.*
Massa Ferri Carbonatis, *U. S.*
Mel Boracis, *Br.*
Despumatum, *U. S., Br.*
Rosæ, *U. S.*
Oxymel, *Br.*
Scillæ, *Br.*
Mentha Piperita.
Oleum Menthæ Piperitæ, *U. S., Br.*
Spiritus Menthæ Piperitæ, *U. S., Br.*
Mentha Viridis.
Oleum Menthæ Viridis, *U. S., Br.*
Spiritus Menthæ Viridis, *U. S.*
Mezereum.
Decoctum Sarsaparillæ Compositum, *U. S., Br.*
Extractum Mezerei Æthereum, *Br.*
Fluidum, *U. S.*
Sarsaparillæ Fluidum Compositum, *U. S.*
Morphinæ Acetas.
Injectio Morphinæ Hypodermica, *Br.*
Liquor Morphinæ Acetatis, *Br.*
Morphinæ Hydrochloras.
Liquor Morphinæ Bimeconatis, *Br.*
Hydrochloratis, *Br.*
Suppositoria Morphinæ, *Br.*
cum Sapone, *Br.*
Tinctura Chloroformi et Morphinæ, *Br.*
Trochisci Morphinæ, *Br.*
et Ipecacuanhæ, *Br.*
Morphinæ Sulphas.
Pulvis Morphinæ Compositus, *U. S.*
Trochisci Morphinæ et Ipecacuanhæ, *U. S.*
Moschus.
Tinctura Moschi, *U. S.*
Myristica.
Oleum Myristicæ, *U. S., Br.*
Expressum, *Br.*
Pulvis Aromaticus, *U. S.*
Catechu Compositus, *Br.*
Cretæ Compositus, *Br.*
Spiritus Armoraciæ Compositus, *Br.*
Tinctura Lavandulæ Composita, *U. S., Br.*
Trochisci Sodii Bicarbonatis, *U. S.*
Myrrha.
Decoctum Aloes Compositum, *Br.*
Mistura Ferri Composita, *U. S., Br.*
Myrrha.
Pilulæ Aloes et Myrrhæ, *U. S., Br.*
Asafœtidæ Composita, *Br.*
Rhei Compositæ, *Br.*
Tinctura Aloes et Myrrhæ, *U. S.*
Myrrhæ, *U. S., Br.*

Nux Vomica.
Extractum Nucis Vomicæ, *U. S., Br.*
Fluidum, *U. S.*
Tinctura Nucis Vomicæ, *U. S., Br.* (made from the extract).

Oleoresina Capsici.
Emplastrum Capsici, *U. S.*
Oleoresina Cubebæ.
Trochisci Cubebæ, *U. S.*
Oleum Adipis.
Unguentum Hydrargyri Nitratis, *U. S.*
Oleum Æthereum.
Spiritus Ætheris Compositus, *U. S.*
Oleum Amygdalæ Amarum.
Aqua Amygdalæ Amarum, *U. S.*
Spiritus Amygdalæ Amarum, *U. S.*
Oleum Amygdalæ Expressum.
Emulsum Chloroformi, *U. S.*
Oleum Phosphoratum, *U. S., Br.*
Unguentum Aquæ Rosæ, *U. S.*
Cetacei, *Br.*
Resinæ, *Br.*
Simplex, *Br.*
Oleum Anisi.
Aqua Anisi, *U. S.*
Elixir Phosphori, *U. S.*
Essentia Phosphori, *Br.*
Spiritus Aurantii Compositus, *U. S.*
Syrupus Sarsaparillæ Compositus, *U. S.*
Tinctura Camphoræ Composita, *Br.*
Opii Ammoniata, *Br.*
Camphorata, *U. S.*
Trochisci Glycyrrhizæ et Opii, *U. S.*
Oleum Aurantii Corticis.
Spiritus Aurantii, *U. S.*
Compositum, *U. S.*
Myrciæ, *U. S.*
Oleum Cajuputi.
Linimentum Crotonis, *Br.*
Spiritus Cajuputi, *Br.*
Oleum Carvi.
Confectio Scammonii, *Br.*
Pilulæ Aloes Barbadensis, *Br.*
Spiritus Juniperi Compositus, *U. S.*
Oleum Cinnamomi.
Aqua Cinnamomi, *U. S.*
Spiritus Cinnamomi, *U. S., Br.*
Oleum Coriandri.
Spiritus Aurantii Compositus, *U. S.*
Syrupus Sennæ, *U. S., Br.*
Oleum Eucalypti.
Unguentum Eucalypti, *Br.*
Oleum Fœniculi.
Aquæ Fœniculi, *U. S.*
Pulvis Glycyrrhizæ Compositus, *U. S.*
Spiritus Juniperi Compositus, *U. S.*
Oleum Gaultheriæ.
Spiritus Gaultheriæ, *U. S.*
Syrupus Sarsaparillæ Compositus, *U. S.*
Trochisci Morphinæ et Ipecacuanhæ, *U. S.*
Oleum Gossypii Seminis.
Linimentum Ammoniæ, *U. S.*
Camphoræ, *U. S.*
Oleum Juniperi.
Spiritus Juniperi, *U. S.*
Compositus, *U. S.*

Oleum Lavandulæ Florum.
Linimentum Camphoræ Compositum, *Br.*
Saponis Mollis, *U. S.*
Spiritus Ammoniæ Aromaticus, *U. S.*
Lavandulæ, *U. S., Br.*
Tinctura Lavandulæ Composita, *U. S., Br.*
Unguentum Diachylon, *U. S.*

Oleum Limonis.
Linimentum Potassii Iodidi cum Sapone, *Br.*
Spiritus Ammoniæ Aromaticus, *U. S., Br.*
Aurantii Compositus, *U. S.*
Limonis, *U. S.*

Oleum Lini.
Linimentum Calcis, *U. S.*

Oleum Menthæ Piperitæ.
Aqua Menthæ Piperitæ, *U. S., Br.*
Essentia Menthæ Piperitæ, *Br.*
Pilulæ Rhei Compositæ, *U. S., Br.*
Vegetabiles Compositæ, *U. S.*
Spiritus Menthæ Piperitæ, *U. S.*
Tinctura Chloroformi et Morphinæ, *Br.*
Trochisci Menthæ Piperitæ, *U. S.*

Oleum Menthæ Viridis.
Aqua Menthæ Viridis, *U. S., Br.*
Spiritus Menthæ Viridis, *U. S.*

Oleum Myrciæ.
Spiritus Myrciæ, *U. S.*

Oleum Myristicæ.
Pilula Aloes Socotrina, *Br.*
Spiritus Ammoniæ Aromaticus, *U. S., Br.*
Myristicæ, *U. S., Br.*

Oleum Olivæ.
Charta Epispastica, *Br.*
Ceratum Cetacei, *U. S.*
Emplastrum Ammoniaci cum Hydrargyro, *Br.*
Ferri, *U. S.*
Hydrargyri, *Br.*
Picis, *Br.*
Burgundicæ, *U. S.*
Plumbi, *U. S., Br.*
Saponis Fuscum, *Br.*
Linimentum Ammoniæ, *Br.*
Calcis, *Br.*
Camphoræ, *Br.*
Unguentum Camphoræ, *Br.*
Diachylon, *U. S.*
Hydrargyri Compositum, *Br.*
Nitratis, *Br.*
Veratrinæ, *U. S., Br.*

Oleum Pimentæ.
Spiritus Myrciæ, *U. S.*

Oleum Ricini.
Collodium Flexile, *U. S., Br.*
Linimentum Sinapis Compositum, *U. S., Br.*
Mistura Olei Ricini, *Br. Add.*
Pilulæ Antimonii Compositæ, *U. S., Br.*
Unguentum Hydrargyri Oxidi Rubri, *U. S.*

Oleum Rosmarini.
Linimentum Saponis, *U. S., Br.*
Spiritus Rosmarini, *Br.*
Tinctura Lavendulæ Composita, *U. S., Br.*

Oleum Sassafras.
Syrupus Sarsaparillæ Compositus, *U. S.*
Trochisci Cubebæ, *U. S.*

Oleum Sinapis Volatile.
Linimentum Sinapis Compositum, *U. S., Br.*

Oleum Terebinthinæ.
Confectio Terebinthinæ, *Br.*
Enema Terebinthinæ, *Br.*
Linimentum Terebinthinæ, *U. S., Br.*
Aceticum, *Br.*
Oleum Terebinthinæ Rectificatum, *U. S.*
Unguentum Terebinthinæ, *Br.*

Oleum Theobromatis.
Suppositoria Acidi Tannici, *Br.*

Oleum Theobromatis.
Suppositoria Hydrargyri, *Br.*
Iodoformi, *Br.*
Morphinæ, *Br.*
Plumbi Composita, *Br.*

Oleum Tiglii.
Linimentum Crotonis, *Br.*

Opium.
Confectio Opii, *Br.*
Emplastrum Opii, *U. S., Br.*
Extractum Opii, *U. S., Br.*
Liquidum, *Br.*
Linimentum Opii, *Br.*
Pilula Ipecacuanhæ et Scillæ, *Br.*
Plumbi et Opii, *Br.*
Saponis Composita, *Br.*
Pilulæ Opii, *U. S.*
Pulv. Cretæ Aromaticus cum Opio, *Br.*
Ipecacuanhæ Compositus, *Br.*
et Opii, *U. S.*
Kino Compositus, *Br.*
Opii Compositus, *Br.*
Suppositoria Plumbi Composita, *Br.*
Tinctura Camphoræ Composita, *Br.*
Ipecacuanhæ et Opii, *U. S.*
Opii, *U. S., Br.*
Deodorati, *U. S.*
Ammoniata, *Br.*
Camphorata, *U. S.*
Trochisci Glycyrrhizæ et Opii, *U. S.*
Opii, *Br.*
Unguentum Gallæ cum Opio, *Br.*
Vinum Opii, *U. S., Br.*

Pareira.
Decoctum Pareiræ, *Br.*
Extractum Pareiræ, *Br.*
Fluidum, *U. S., Br.*

Pepsinum.
Pepsininum Saccharatum, *U. S.*

Petrolatum Molle.
Unguentum Acidi Borici, *Br.*
Carbolici, *Br.*
Salicylici, *Br.*
Eucalypti, *Br.*
Glycerini Plumbi Subacetatis, *Br.*
Hydrargyri Oxidi Rubri, *Br.*
Nitratis Dilutum, *Br.*
Potassæ Sulphuratæ, *Br.*
Sulphuris Iodidi, *Br.*
Veratrinæ, *Br.*
Zinci Oleati, *Br.*

Phosphorus.
Elixir Phosphori, *U. S.*
Oleum Phosphoratum, *U. S., Br.*
Pilula Phosphori, *U. S., Br.*
Spiritus Phosphori, *U. S.*

Phytolaccæ Radix.
Extractum Phytolaccæ Fluidum, *U. S.*

Pilocarpus.
Extractum Jaborandi, *Br.*
Pilocarpi Fluidum, *U. S.*
Infusum Jaborandi, *Br.*

Physostigma.
Extractum Physostigmatis, *U. S., Br.*
Tinctura Physostigmatis, *U. S.*

Pimenta.
Aqua Pimentæ, *Br.*

Piper.
Confectio Opii, *Br.*
Piperis, *Br.*
Oleoresina Piperis, *U. S.*
Pulvis Opii Compositus, *Br.*

Pix Burgundica.
Emplastrum Ferri, *U. S., Br.*

Pix Burgundica.
Emplastrum Opii, *U. S.*
Picis, *Br.*
Burgundicæ, *U. S.*
Cantharidatum, *U. S.*
Pix Liquida.
Syrupus Picis Liquidæ, *U. S.*
Unguentum Picis Liquidæ, *U. S., Br.*
Plumbi Acetas.
Glycerinum Plumbi Subacetatis, *Br.*
Liquor Plumbi Subacetatis, *U. S., Br.*
Pilula Plumbi Composita, *Br.*
Suppositoria Plumbi Composita, *Br.*
Plumbi Carbonas.
Unguentum Plumbi Carbonatis, *U. S., Br.*
Plumbi Iodidum.
Emplastrum Plumbi Iodidi, *Br.*
Unguentum Plumbi Iodidi, *U. S., Br.*
Plumbi Oxidum.
Emplastrum Plumbi, *U. S., Br.*
Saponis Fuscum, *Br.*
Liquor Plumbi Subacetatis, *U. S., Br.*
Podophyllum.
Extractum Podophylli, *U. S.*
Fluidum, *U. S.*
Resina Podophylli, *U. S., Br.*
Potassa.
Liquor Potassæ, *U. S., Br.*
Potassa cum Calce, *U. S.*
Potassa Sulphurata.
Unguentum Potassæ Sulphuratæ, *Br.*
Potassii Bicarbonas.
Liquor Potassæ Effervescens, *Br.*
Potassii Arsenitis, *U. S.*
Citratis, *U. S.*
Potassii Bitartras.
Confectio Sulphuris, *Br.*
Pulvis Jalapæ Compositus, *U. S., Br.*
Trochisci Sulphuris, *Br.*
Potassii Carbonas.
Decoctum Aloes Compositum, *Br.*
Liquor Arsenicalis, *Br.*
Mistura Ferri Composita, *U. S., Br.*
Pilulæ Ferri Carbonatis, *U. S.*
Potassa Sulphurata, *U. S., Br.*
Potassii Chloras.
Trochisci Potassii Chloratis, *U. S., Br.*
Potassii Ferrocyanidum.
Acidum Hydrocyanicum Dilutum, *U. S., Br.*
Potassii Hypophosphis.
Syrupus Hypophosphitum Compositum, *U. S.*
Acidi Hydriodici, *U. S.*
Potassii Iodidum.
Linimentum Iodi, *Br.*
Potassii Iodidi cum Sapone, *Br.*
Liquor Iodi, *Br.*
Compositus, *U. S.*
Syrupus Acidi Hydriodici, *U. S.*
Tinctura Iodi, *Br.*
Unguentum Iodi, *U. S., Br.*
Potassii Iodidi, *U. S., Br.*
Potassii Nitras.
Argenti et Potassii Nitras, *Br.*
Nitras Dilutus, *U. S.*
Charta Potassii Nitratis, *U. S.*
Potassii Permanganas.
Liquor Potassii Permanganatis, *Br.*
Potassii Sulphas.
Pilula Colocynthidis Composita, *Br.*
et Hyoscyami, *Br.*
Ipecacuanhæ cum Scilla, *Br.*
Pulvis Ipecacuanhæ Compositus, *Br.*
Prunum.
Confectio Sennæ, *U. S., Br.*
Prunus Virginiana.
Extractum Pruni Virginianæ Fluidum, *U. S.*
Infusum Pruni Virginianæ, *U. S.*
Syrupus Pruni Virginianæ, *U. S.*
Pyrethrum.
Tinctura Pyrethri, *U. S., Br.*
Pyroxylin.
Collodium, *U. S., Br.*
Vesicans, *Br.*

Quassia.
Extractum Quassiæ, *U. S., Br.*
Fluidum, *U. S.*
Tinctura Quassiæ, *U. S., Br.*
Quillaja.
Tinctura Quillajæ, *U. S.*
Quinina.
Ferri et Quininæ Citras, *U. S., Br.*
Solubilis, *U. S.*
Quininæ Hydrochloras.
Tinctura Quininæ, *Br.*
Quininæ Sulphas.
Syrupus Ferri Quininæ et Strychninæ Phosphatum, *U. S.*
Tinctura Quininæ Ammoniata, *Br.*
Vinum Quininæ, *Br.*

Resina.
Charta Epispastica, *Br.*
Ceratum Cantharidis, *U. S.*
Resinæ, *U. S.*
Emplastrum Calefaciens, *Br.*
Cantharidis, *Br.*

LEA BROTHERS & CO.'S

CLASSIFIED CATALOGUE OF

Medical and Surgical Publications.

IN ASKING the attention of the profession to the works advertised in the following pages, the publishers would state that no pains are spared to secure a continuance of the confidence earned for the publications of the house by their careful selection and accuracy and finish of execution.

The printed prices are those at which books can generally be supplied by booksellers throughout the United States, who can readily procure for their customers any works not kept in stock. Where access to bookstores is not convenient, books will be sent by mail by the publishers postpaid on receipt of the printed price, and as the limit of mailable weight has been removed, no difficulty will be experienced in obtaining through the post-office any work in this catalogue. No risks however are assumed either on the money or on the books, and no publications but our own are supplied, so that gentlemen will in most cases find it more convenient to deal with the nearest bookseller.

LEA BROTHERS & CO.

Practical Medical Periodicals.

THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES, Monthly, $4.00 per annum.

THE MEDICAL NEWS, Weekly, $4.00 per annum.

All four aggregating ***$10.75*** *for* ***$7.50*** *per annum, To one address, postpaid.*

THE MEDICAL NEWS VISITING LIST (4 styles, see page 2), $1.25. With either or both above periodicals, in advance, 75 cents.

THE YEAR-BOOK OF TREATMENT (see page 13), $1.50. With either JOURNAL or NEWS, or both, 75 cents. Or JOURNAL, NEWS, VISITING LIST AND YEAR-BOOK, $8.50, in advance.

THE MEDICAL NEWS.

Subscription Price Reduced to $4.00 Per Annum.

BY KEEPING closely in touch with the needs of the active practitioner, The News has achieved a reputation for utility so extensive as to render practicable its reduction in price from five to **Four Dollars** per annum. It is now by far the cheapest as well as the best large weekly medical

(*Continued on next page.*)

THE MEDICAL NEWS—*Continued.*

journal published in America. Employing all the recognized resources of modern journalism, such as the cable, telegraph, resident correspondents, special reporters, etc., THE NEWS supplies in the 28 quarto pages of each issue the latest and best information on subjects of importance and value to practitioners in all branches of medicine. The foremost writers, teachers and practitioners of the day furnish original articles, clinical lectures and notes on practical advances; the latest methods in leading hospitals are constantly reported; a condensed summary of progress is gleaned each week from a large exchange list, comprising the best journals at home and abroad; a special department is assigned to abstracts requiring full treatment for proper presentation; editorial articles are secured from writers able to deal instructively with questions of the day; books are carefully reviewed; society proceedings are represented by the pith alone; regular correspondence is furnished by gentlemen in position to know all occurrences of importance in large medical centres, and minor matters of interest are grouped each week under news items. Everything is presented with such brevity as is compatible with clearness, and in the most attractive manner. In a word THE MEDICAL NEWS is a crisp, fresh weekly professional newspaper and as such occupies a well-marked sphere of usefulness, distinct from and complementary to the ideal monthly magazine, THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES.

The American Journal of the Medical Sciences

PUBLISHED MONTHLY AT $4.00 PER ANNUM.

For Commutation Rates see preceding page.

THE AMERICAN JOURNAL enters with 1894 upon its seventy-fifth year, still maintaining the foremost place among the medical magazines of the world. A vigorous existence during two and a half generations of men amply proves that it has always adapted itself to meet fully the requirements of the time.

Being the medium chosen by the best minds of the profession during this period for the presentation of their ablest papers, THE AMERICAN JOURNAL has well earned the praise accorded it by an unquestioned authority—"from this file alone, were all other publications of the press for the last fifty years destroyed, it would be possible to reproduce the great majority of the real contributions of the world to medical science during that period." Original Articles, Reviews and Progress, the three main departments into which the contents of THE JOURNAL are divided, will be found to possess still greater interest than in the past. The brightest talent on both sides of the Atlantic is enlisted in its behalf, and no effort will be spared to make THE JOURNAL more than ever worthy of its position as the representative of the highest form of medical thought.

The Medical News Visiting List for 1894.

Published in four styles, Weekly (dated for 30 patients); Monthly (undated, for 120 patients per month; Perpetual (undated, for 30 patients weekly per year); and Perpetual (undated, for 60 patients weekly per year). The 60-patient Perpetual consists of 256 pages of assorted blanks. The first three styles contain 32 pages of important data and 176 pages of assorted blanks. Each style is in one wallet-shaped book, leather-bound, with pocket, pencil, rubber, and catheter-scale. Price, each, $1.25.

For convenience and elegance it is not surpassable.—*Obstetric Gazette.*

This list is all that could be desired. It contains a vast amount of useful information, especially for emergencies, and gives good tables of doses and therapeutics.—*Canadian Practitioner.*

The Medical News Physicians' Ledger.

Containing 300 pages of fine linen "ledger" paper, ruled so that all the accounts of a large practice may be conveniently kept in it, either by single or double entry, for a long period. Strongly bound in leather, with cloth sides, and with a patent flexible back, which permits it to lie perfectly flat when opened at any place. Price, $4.00.

☞ *Subscribers can obtain at the close of each volume, cloth covers for* THE JOURNAL *(one annually), and for* THE NEWS *(one annually), free by mail, by remitting Ten Cents for* THE JOURNAL *cover, and Fifteen Cents for* THE NEWS *cover.*

☞ The safest mode of remittance is by bank check or postal money order, drawn to the order of the undersigned; where these are not accessible, remittance for subscriptions may be sent at the risk of the publishers by forwarding in *registered* letters. Address

Lea Brothers & Co., Publishers, 706, 708 & 710 Sansom Street, Philadelphia.

A NEW MEDICAL DICTIONARY. JUST READY.

THE STUDENTS'
Dictionary of Medicine
AND THE ALLIED SCIENCES.

COMPRISING THE PRONUNCIATION, DERIVATION AND FULL EXPLANATION OF MEDICAL TERMS; TOGETHER WITH MUCH COLLATERAL DESCRIPTIVE MATTER, NUMEROUS TABLES, ETC.

By ALEXANDER DUANE, M.D.,
Assistant Surgeon to the New York Ophthalmic and Aural Institute; Reviser of Medical Terms for Webster's International Dictionary.

In one Square 8vo. Vol. of 658 pages. Cloth, $4.25; Half Leather, $4.50; Full Sheep, $5.00.

This work should certainly bear the closest examination, as it is the result of the labor of a man abundantly qualified in every way for the difficult task. Dr. Duane is known as the Reviser of Medical Terms for Webster's *International Dictionary*. The special training he received in that work has served as the best of preparations for a volume of this character. Medical students are here provided with full information concerning every word they will meet in acquiring their professional education. Each word is followed by its correct pronunciation, shown by means of simple phonetic spelling. The definitions of the words are of an explanatory style, giving much descriptive matter as well as a statement of meaning. We thus have a volume that must receive attention for its practical utility. The size of the book is such that it can be used without disadvantage, while the price brings it within the reach of the largest number of those needing it. There can be no doubt but that it will have a most extensive sale among all students of medicine, while its clear and sufficient definitions will make it a good working volume for the practitioner.—*The National Medical Review*, December, 1893.

It is eminently a work for the medical student. A special feature of this work is the omission of obsolete terms, thus making room for fuller definitions of those in use. This, with the tabulation of many subjects and the use of cross-references, not only accomplishes the purpose, but facilitates ease of reference—a most desirable quality in any dictionary. Another feature in the phonetic system of pronunciation instead of the more or less elaborate system of diacritical marks generally used by lexicographers. Inspection shows that the correct pronunciation is easily conveyed. The definitions are unusually clear and concise, and in many cases almost encyclopedic. The author's work in revising the medical terms of Webster's *International Dictionary* would specially fit him for his task, which he has undoubtedly done well.—*The Pittsburg Medical Review*, December, 1893.

Confidence in this book is immediateiy established when we know that its author is Reviser of Medical Terms for Webster's *International Dictionary*, and this confidence is not shaken by a closer investigation. The pronunciation is given by an easily,comprehensible system. Etymology is a great aid in carrying a word in the mind, and it is consistently given. In words of Greek origin the author has best subserved the needs of the average student by giving the roots in English characters. The definitions are explicit, and in the case of diseases, drugs, etc., general information relative to the subject is given. The work is well planned and faithfully executed.—*American Medico-Surgical Bulletin*, January 1, 1894.

The National Medical Dictionary,

INCLUDING ENGLISH, FRENCH, GERMAN, ITALIAN AND LATIN TECHNICAL TERMS USED IN MEDICINE AND THE COLLATERAL SCIENCES, AND A SERIES OF TABLES OF USEFUL DATA.

By JOHN S. BILLINGS, M.D., LL.D., Edin. and Harv., D.C.L., Oxon.,
Member of the National Academy of Sciences, Surgeon U. S. A., etc.

In Two very Handsome Royal Octavo Volumes containing 1574 Pages, with Two Colored Plates. Per Volume—cloth, $6.00; leather, $7.00; half Morocco, marbled edges, $8.50.

For sale by subscription only. Specimen pages on application. Address the Publishers.

Its scope is one which will at once satisfy the student and meet all the requirements of the medical practitioner. The work is remarkable, too, for its fulness. It presents to the English reader a thoroughly scientific mode of acquiring a rich vocabulary and offers an accurate and ready means of reference in consulting works in any of the three modern continental languages which are richest in medical literature. Apart from the boundless stores of information which may be gained by the study of a good dictionary, one is enabled by the work under notice to read intelligently any technical treatise in any of the four chief modern languages. There cannot be two opinions as to the great value and usefulness of this dictionary as a book of ready reference for all sorts and conditions of medical men. So far as we have been able to see, no subject has been omitted, and in respect of completeness it will be found distinctly superior to any medical lexicon yet published.—*The London Lancet*, April 5, 1890.

Hoblyn's Dictionary of Medicine.

A Dictionary of the Terms Used in Medicine and the Collateral Sciences. By Richard D. Hoblyn, M.D. Revised, with numerous additions, by Isaac Hays, M.D., late Editor of the American Journal of the Medical Sciences. In one large royal 12mo. volume of 520 double-columned pages. Cloth, $1.50; leather, $2.00.

NEW (21ST) EDITION. THOROUGHLY REVISED. JUST READY.

DUNGLISON'S DICTIONARY OF MEDICAL SCIENCE.

CONTAINING A FULL EXPLANATION OF THE VARIOUS SUBJECTS AND TERMS OF ANATOMY, PHYSIOLOGY, MEDICAL CHEMISTRY, PHARMACY, PHARMACOLOGY, THERAPEUTICS, MEDICINE, HYGIENE, DIETETICS, PATHOLOGY, SURGERY, OPHTHALMOLOGY, OTOLOGY, LARYNGOLOGY, DERMATOLOGY, GYNECOLOGY, OBSTETRICS, PEDIATRICS, MEDICAL JURISPRUDENCE AND DENTISTRY, ETC., ETC.

By ROBLEY DUNGLISON, M.D., LL.D.,

Late Professor of Institutes of Medicine in the Jefferson Medical College of Philadelphia.

Edited by RICHARD J. DUNGLISON, A.M., M.D.

New (21st) edition, thoroughly revised, greatly enlarged and improved, with the

PRONUNCIATION, ACCENTUATION, AND DERIVATION OF THE TERMS.

In one magnificent imperial octavo volume of 1191 pages. Cloth, $7.00; leather, $8.00.

THIS great medical dictionary, which has been for more than two generations the standard of the English-speaking race, is now, after several years of incessant labor, issued in a thoroughly revised and greatly enlarged and improved edition. The new words and phrases aggregate by actaul count over 44,000, and by themselves would fill a large volume. Space has been gained by the excision of everything obsolete, and the page has been much enlarged, so that while the new edition contains far more matter than its predecessor, the whole is accommodated within a volume convenient for the hand.

The revision has not only covered every word but it has resulted in a number of important new features designed to confer on the work the utmost usefulness, and to make it answer the most advanced demands of the times.

Pronunciation has been introduced throughout by means of a simple and obvious system of phonetic spelling. At a glance the proper sound of a word is clearly indicated, and thus a most important desideratum is supplied.

Derivation affords the utmost aid in recollecting the meanings of words, and gives the power of analyzing and understanding those which are unfamiliar. It is here indicated in the simplest manner. Greek words are spelled with English letters, and thus placed at the command of those unfamiliar with the Greek alphabet.

Definitions, the essence of a dictionary, are clear and full, a characteristic in which this work has always been preëminent. In this edition much explanatory and encyclopedic matter has been added, especially upon subjects of practical importance. Thus under the various Diseases will be found their symptoms, treatment, etc.; under Drugs their doses and effects, under Poisoning the symptoms, treatment and antidotes, etc., etc. A vast amount of information has been clearly and conveniently condensed into tables in the alphabet.

The typography is thoroughly in keeping with the excellence of the literary material. In a word, both the editor and the publishers have felt that the world-wide reputation of *Dunglison's Dictionary* has rendered it incumbent on them to ensure that in its remodelled and enlarged shape it should be found equal to all that the student and practitioner can expect from such a work.

The new "Dunglison" is new indeed. The vast amount of new matter and the thoroughness with which the work has been brought down to date cannot fail to strike even the least observant reader. The immense advances made in all branches of medical science here find representation. A prominent and very useful feature of the old book is retained and amplified in this—we mean the tables, which recur with great frequency and represent a vast amount of condensed information. In respect to accuracy the book quite equals and usually surpasses any of its contemporaries that we are acquainted with. The new "Dunglison" has been brought down to date, so as to represent adequately the latest advances in medical science.—*The American Journal of the Medical Sciences*, January, 1894.

Of all the numerous books published in recent years not one can compare with it in usefulness or in popularity. Much new matter has been added so that it comprises everything. Pronunciation is now, for the first time, introduced into the work, which addition renders it more useful than ever to the profession.—*The Nashville Journal of Medicine and Surgery*, Oct., 1893.

Their estimate of Dunglison's *Dictionary* led the compilers of Webster's *Unabridged* to adopt almost bodily its terms and definitions in the preparation of that great work. The present edition is thoroughly abreast of the times. More than 40,000 new terms and definitions, and many new and valuable tables not before published are incorporated in the text. The *derivations* of words are clearly and fully given, thus affording facility for analyzing complex or compound expressions. Its *definitions* are concise, full and satisfactory. For the first time it may be termed a "pronouncing" dictionary. By means of phonetic spelling it will greatly facilitate the attainment of uniformity in pronunciation.—*The North American Practitioner*, October, 1893.

Dunglison's *Medical Dictionary* has been the standard authority on medical nomenclature for a very long period, fully sixty years, in this time having passed through twenty-one editions, and being still constantly used for reference by the great majority of practitioners. The simple phonetic spelling placed after each word shows clearly how it should be pronounced. This feature adds immeasurably to its value as a dictionary. Numerous tables have been introduced, replete with valuable and practical information. Under Diseases is included a concise review of the symptomatology and treatment; under Drugs may be found their properties and doses, and under Poisoning the symptoms, antidotes and treatment. Taken as a whole, it has all the advantages of other works without their disadvantages, is excelled by none, and will surely remain a standard for many years to come.—*The Albany Medical Annals*, Dec., 1893.

The great learning and ability of the Editor, with his thorough and long experience in the work, establishes "Dunglison" as the standard for pronunciation, as it has been for more than fifty years on definition and terminology.—*Pacific Medical Journal*, January, 1894.

There have been medical dictionaries and medical dictionaries, but, after all, none of them so valuable to the medical profession as Dunglison's.—*Cincinnati Lancet-Clinic*, September 30, 1893.

New (Thirteenth) Edition. Just Ready.

GRAY'S ANATOMY,

IN COLORS OR IN BLACK.

Anatomy, Descriptive and Surgical.

By HENRY GRAY, F.R.S.,

LECTURER ON ANATOMY AT ST. GEORGE'S HOSPITAL, LONDON.

Edited by T. PICKERING PICK, F.R.C.S.,

Surgeon to and Lecturer on Anatomy at St. George's Hospital, London, Examiner in Anatomy, Royal College of Surgeons of England.

A NEW AMERICAN FROM THE THIRTEENTH ENLARGED AND IMPROVED LONDON EDITION.

In one imperial octavo volume of 1100 pages, with 635 large and elaborate engravings on wood.
Price of edition with illustrations in colors (see below): Cloth, $7.00; leather, $8.00.
Price of edition with illustrations in black: Cloth, $6.00; leather, $7.00.

SINCE 1857 *Gray's Anatomy* has been the standard work used by students of medicine and practitioners in all English-speaking races. So preëminent has it been among the many works on the subject that thirteen editions have been required to meet the demand. This opportunity for frequent revisions has been fully utilized and the work has thus been subjected to the careful scrutiny of many of the most distinguished anatomists of a generation, and thus a degree of completeness and accuracy has been secured which is not attainable in any other way. In no former revision has so much care been exercised as in the present to provide for the student all the assistance that a text-book can furnish.

The engravings have always formed a distinguishing feature of the work, and in the present edition the series has been enriched and rendered complete by the addition of many new ones. The large scale on which the illustrations are drawn and the clearness of the execution render them of unequalled value in affording a grasp of the complex details of the subject. As heretofore the name of each part is printed upon it, thus conveying to the eye at once the position, extent and relations of each organ, vessel, muscle, bone or nerve with a clearness impossible when figures or lines of reference are employed. Distinctive colors have been used to give additional prominence to the attachments of muscles, and to the veins, arteries and nerves. For the sake of those who prefer not to pay the slight increase in cost necessitated by the use of colors the volume is published also in black alone.

The illustrations thus constitute a complete and splendid series, which will greatly assist the student in forming a clear idea of Anatomy, and will also serve to refresh the memory of those who may find in the exigencies of practice the necessity of recalling the details of the dissecting-room. Combining, as it does, a complete Atlas of Anatomy with a thorough treatise on systematic, descriptive and applied Anatomy, the work will be found of great service to all physicians who receive students in their offices, relieving both preceptor and pupil of much labor in laying the groundwork of a thorough medical education.

As this work covers a more extended range of subjects than is customary in the ordinary text-books, giving not only the details necessary for the student, but also the application of those details to the practice of medicine and surgery, it furnishes both a guide for the learner and an admirable work of reference for the active practitioner.

No book deals with the complex subject so systematically, or presents the material in a way better fitted for the student to memorize. A constant effort has been made to demonstrate the topographical relations of the various structures of the human anatomy in the clearest and most forcible way. This new edition has undergone thorough revision. New illustrations have been added wherever it was considered that they would add value to the text. The colored plates add much to its clearness. Much new material has been added to this thirteenth edition. The reviewer can have nothing but words of praise for this work, which is the peer of all works on anatomy.—*International Medical Magazine*, December, 1893.

For thirty-five years *Gray's Anatomy* has been the universal text-book for medical students and surgeons. Nothing but the highest praise can be extended in favor of this work, and continued success is only to be expected of a book which still stands at the pinnacle of anatomical works.—*The St. Louis Clinique*, November, 1893.

Apparently anatomies may come and anatomies may go, but this is perennially a favorite and will go on forever.—*New York Medical Journal*, November 11, 1893.

The hold which *Gray's Anatomy* has had upon generation after generation of medical students for nearly half a century remains unbroken. During this time several other text-books designed to cover the same ground have been issued but have failed to take the place of the students' favorite.—*Columbus Medical Journal*, October, 1893.

No medical student is, in our opinion, well equipped without a *Gray's Anatomy*.—*Pittsburg Medical Review*, November, 1893.

It embraces the whole of human anatomy, and it particularly dwells on the practical or applied part of the subject, so that it forms a most useful, intelligible and practical treatise for the student and general practitioner.—*Dublin Journal of Medical Science*, December, 1893.

Gray's Anatomy is not without competition, but as a text-book it is unrivalled in so many departments that nothing is needed to commend it.—*Physician and Surgeon*, November, 1893.

The rapidity of sale of the work, almost unprecedented in the annals of medical literature, indicates that it fulfils the requirements of the average medical student to perfection.—*Glasgow Medical Journal*, January, 1894.

Human Monstrosities.

By BARTON C. HIRST, M.D., *Professor of Obstetrics in the University of Pennsylvania.* and GEORGE A. PIERSOL, M.D., *Professor of Anatomy and Embryology in the University of Pennsylvania.*

Magnificent folio, containing 220 pages of text, illustrated with 123 engravings and 39 full-page photographic plates from nature. In four parts, price, each, $5.00. Complete work just ready. Limited edition, for sale by subscription only. *Address the Publishers.*

We have before us the fourth and last part of the latest and best work on human monstrosities. This completes one of the masterpieces of American medical literature. Typographically and from an artistic standpoint, the work is unexceptionable. In this last and final volume is presented the most complete bibliography of teratological literature extant. No library will be complete without this magnificent work.—*Journal of the American Medical Association*, May 6, 1893.

It will take its place as a standard work on teratology in medical libraries, and it must always retain the honor of being the first of its kind written in the English language. —*The British Medical Journal*, May 27, 1893.

The authors have sought to present in a concise and convenient form a treatise on Teratology which the obstetrician and pathologist can consult for an explanation and classification of the graver anomalies in development occasionally met with in medical practice. So far as we know there has been hitherto no comprehensive work on the subject in the English language, the literature of the subject in English being scattered and not always easy of access. The authors of the work before us have placed the English-speaking profession greatly in their debt by undertaking what must have largely been a labor of love and by producing a work which certainly fills a gap in English medical literature.—*Boston Medical and Surgical Journal*, January 12, 1893.

This work promises to be one for which a place must be found in the library of every anatomist, pathologist, obstetrician, and teratologist. It is the joint production of an obstetrician, and an embryologist and histologist, and this fact makes it certain that both the obstetric and anatomical sides of the subject will be fully represented and described. The book promises to be one of the greatest value to the English-speaking medical world.—*Edinburgh Medical Journal*, April, 1892.

Allen's System of Human Anatomy.

A System of Human Anatomy, Including its Medical and Surgical Relations. For the use of Practitioners and Students of Medicine. By HARRISON ALLEN, M.D., Professor of Physiology in the University of Pennsylvania. With an Introductory Section on Histology by E. O. SHAKESPEARE, M.D., Ophthalmologist to the Philadelphia Hospital. Comprising 813 double-columned quarto pages, with 380 illustrations on 109 full-page lithographic plates, many of which are in colors, and 241 engravings in the text. In six Sections, each in a portfolio. Price, per Section, $3.50; also bound in one volume, cloth, $23.00; half Russia, $25.00. *For sale by subscription only. Address the Publishers.*

Anatomy.

Cloth, $1.00. See *The Students' Quiz Series*, page 30.

Holden's Landmarks, Medical and Surgical.

Landmarks, Medical and Surgical. By LUTHER HOLDEN, F.R.C.S., Surgeon to St. Bartholomew's and the Foundling Hospitals, London. Second American from the third and revised English edition, with additions by W. W. KEEN, M.D., Professor of Artistic Anatomy in the Penna. Academy of Fine Arts. In one 12mo. volume of 148 pages. Cloth, $1.00.

Anatomy. Cloth. $1.00. See *The Students' Quiz Series*, page 30.

Clarke & Lockwood's Dissector's Manual.

The Dissector's Manual. By W. B. CLARKE, F.R.C.S., and C. B. LOCKWOOD, F.R.C.S., Demonstrators of Anatomy at St. Bartholomew's Hospital Medical School, London. In one 12mo. volume of 396 pages, with 49 illustrations. Limp cloth, red edges, $1.50. See *Students' Series of Manuals*, page 30.

Treves' Surgical Applied Anatomy.

Surgical Applied Anatomy. By FREDERICK TREVES, F.R.C.S., Senior Demonstrator of Anatomy and Assistant Surgeon at the London Hospital. In one pocket-size 12mo. volume of 540 pages, with 61 illustrations. Limp cloth, red edges, $2.00. See *Students' Series of Manuals*, page 30.

Bellamy's Surgical Anatomy.

The Student's Guide to Surgical Anatomy: Being a Description of the most Important Surgical Regions of the Human Body, and intended as an Introduction to Operative Surgery. By EDWARD BELLAMY, F.R.C.S., Senior Assistant-Surgeon to the Charing-Cross Hospital. In one 12mo. volume of 300 pages, with 50 illustrations. Cloth, $2.25.

Wilson's Human Anatomy.

A System of Human Anatomy, General and Special. By ERASMUS WILSON, F.R.S. Edited by W. H. GOBRECHT, M.D., Professor of General and Surgical Anatomy in the Medical College of Ohio. In one large and handsome octavo volume of 616 pages, with 397 illustrations. Cloth, $4.00; leather, $5.00.

Cleland's Dissector.

A Directory for the Dissection of the Human Body. By JOHN CLELAND, M.D., Professor of Anatomy, Queen's College, Galway. 12mo. 178 pages. Cloth, $1.25.

HARTSHORNE'S HAND-BOOK OF ANATOMY AND PHYSIOLOGY. Second edition, revised. 12mo., 310 pages, 220 woodcuts. Cloth, $1.75.

HORNER'S SPECIAL ANATOMY AND HISTOLOGY. Eighth edition. In two octavo volumes of 1007 pages, with 320 woodcuts. Cloth, $6.00.

Draper's Medical Physics.

Medical Physics. A Text-book for Students and Practitioners of Medicine. By JOHN C. DRAPER, M.D., LL.D., Professor of Chemistry in the University of the City of New York. In one octavo volume of 734 pages, with 376 woodcuts, mostly original. Cloth, $4.00.

While all enlightened physicians will agree that a knowledge of physics is desirable for the medical student, only those actually engaged in the teaching of the primary subjects can be fully aware of the difficulties encountered by students who attempt the study of these subjects without a knowledge of either physics or chemistry. These are especially felt by the teacher of physiology.

It is, however, impossible for him to impart a knowledge of the main facts of his subject and establish them by reasons and experimental demonstration, and at the same time undertake to teach *ab initio* the principles of chemistry or physics. Hence the desirability, we may say the necessity, for some such work as the present one.

No man in America was better fitted than Dr. Draper for the task he undertook and he has provided the student and practitioner of medicine with a volume at once readable and thorough. Even to the student who has some knowledge of physics this book is useful, as it shows him its applications to the profession that he has chosen. Dr. Draper, as an old teacher, knew well the difficulties to be encountered in bringing his subject within the grasp of the average student, and that he has succeeded so well proves once more that the man to write for and examine students is the one who has taught and is teaching them. The book is well printed and fully illustrated, and in every way deserves grateful recognition.—*Montreal Med. Jour.*, July, 1890.

Chemistry and Physics.

Cloth, $1.00. See *The Students' Quiz Series*, page 30.

Power's Human Physiology.—Second Edition.

Human Physiology. By HENRY POWER, M.B., F.R.C.S., Examiner in Physiology, Royal College of Surgeons of England. Second edition. In one 12mo. volume of 509 pages, with 68 illustrations. Cloth, $1.50. See *Students' Series of Manuals*, page 30.

Robertson's Physiological Physics.

Physiological Physics. By J. MCGREGOR ROBERTSON, M.A., M.B., Muirhead Demonstrator of Physiology, University of Glasgow. In one 12mo. volume of 537 pages, with 219 illustrations. Limp cloth, $2.00. See *Students' Series of Manuals*, page 30.

The title of this work sufficiently explains the nature of its contents. It is designed as a manual for the student of medicine, an auxiliary to his text-book in physiology, and it would be particularly useful as a guide to his laboratory experiments. It will be found of great value to the practitioner. It is a carefully prepared book of reference, concise and accurate, and as such we heartily recommend it.—*Journal of the American Medical Association*, Dec. 6, 1884.

Dalton on the Circulation of the Blood.

Doctrines of the Circulation of the Blood. A History of Physiological Opinion and Discovery in regard to the Circulation of the Blood. By JOHN C. DALTON, M.D., Professor Emeritus of Physiology in the College of Physicians and Surgeons, New York. In one handsome 12mo. volume of 293 pages. Cloth, $2.00.

Dr. Dalton's work is the fruit of the deep research of a cultured mind, and to the busy practitioner it cannot fail to be a source of instruction. It will inspire him with a feeling of gratitude and admiration for those plodding workers of olden times, who laid the foundation of the magnificent temple of medical science as it now stands.—*New Orleans Medical and Surgical Journal*, Aug. 1885.

Bell's Comparative Anatomy and Physiology.

Comparative Anatomy and Physiology. By F. JEFFREY BELL, M.A., Professor of Comparative Anatomy at King's College, London. In one 12mo. volume of 561 pages, with 229 illustrations. Limp cloth, $2.00. See *Students' Series of Manuals*, page 30.

The manual is preëminently a student's book—clear and simple in language and arrangement. It is well and abundantly illustrated, and is readable and interesting. On the whole we consider it the best work in existence in the English language to place in the hands of the medical student.—*Bristol Medico-Chirurgical Journal*, March. 1886.

Ellis' Demonstrations of Anatomy.—Eighth Edition.

Demonstrations of Anatomy. Being a Guide to the Knowledge of the Human Body by Dissection. By GEORGE VINER ELLIS, Emeritus Professor of Anatomy in University College, London. From the eighth and revised London edition. In one very handsome octavo volume of 716 pages, with 249 illustrations. Cloth, $4.25; leather, $5.25.

Roberts' Compend of Anatomy.

The Compend of Anatomy. For use in the dissecting-room and in preparing for examinations. By JOHN B. ROBERTS, A.M., M.D., Lecturer in Anatomy in the University of Pennsylvania. In one 16mo. volume of 196 pages. Limp cloth, 75 cents.

Wohler's Outlines of Organic Chemistry. Edited by FITTIG. Translated by IRA REMSEN, M.D., Ph.D. In one 12mo. volume of 550 pages. Cloth, $3.00.

LEHMANN'S MANUAL OF CHEMICAL PHYSIOLOGY. In one octavo volume of 327 pages, with 41 illustrations. Cloth, $2.25.

CARPENTER'S HUMAN PHYSIOLOGY. Edited by HENRY POWER. In one octavo volume.

CARPENTER'S PRIZE ESSAY ON THE USE AND ABUSE OF ALCOHOLIC LIQUORS IN HEALTH AND DISEASE. With explanations of scientific words. Small 12mo. 178 pages. Cloth, 60 cents.

Foster's Physiology.—New (5th) American Edition.

Text-Book of Physiology. By MICHAEL FOSTER, M.D., F.R.S., Prelector in Physiology and Fellow of Trinity College, Cambridge, England. New (fifth) and enlarged American from the fifth and revised English edition, with notes and additions. In one handsome octavo volume of 1083 pages, with 316 illustrations. Cloth, $4.50; leather, $5.50. *Just ready.*

This is the standard work on physiology, being most thorough and complete in all branches and details; moreover it contains considerable material which has never before been presented to the medical public. Evidence of its success is shown in the fact that it is now in its fifth English and fifth American edition. In its high character, in the care which is shown in the statements and their verification, and in its thorough dealing with physiological and histological problems, it is far ahead of any book of the class yet issued. Words of praise are inadequate.—*The Medical Age*, December 26, 1893.

The rapid exhaustion of four large American editions and the call for a fifth are about all the introduction this valuable text-book will need. The work will continue to afford students and practitioners an ample knowledge of this fundamental medical science. The Author has thoroughly revised this edition with notes and additions. The task of the American Editor has been mostly confined to the adaptation of the work to the wants of the American student, and we predict a large sale for it. It is now used as a text-book in many colleges, and the new edition with its many improvements will still further increase the popularity of the work.—*Kansas City Medical Record*, December, 1893.

Dalton's Physiology.—Seventh Edition.

A Treatise on Human Physiology. Designed for the use of Students and Practitioners of Medicine. By JOHN C. DALTON, M.D., Professor of Physiology in the College of Physicians and Surgeons, New York, etc. Seventh edition, thoroughly revised and rewritten. In one very handsome octavo volume of 722 pages, with 252 beautiful engravings on wood. Cloth, $5.00; leather, $6.00.

From the first appearance of the book it has been a favorite, owing as well to the author's renown as an oral teacher as to the charm of simplicity with which, as a writer, he always succeeds in investing even intricate subjects. It must be gratifiying to him to observe the frequency with which his work, written for students and practitioners, is quoted by other writers on physiology. This fact attests its value, and, in great measure, its originality. It now needs no such seal of approbation, however, for the thousands who have studied it in its various editions have never been in any doubt as to its sterling worth.—*N. Y. Medical Journal*, Oct. 1882.

Professor Dalton's well-known and deservedly-appreciated work has long passed the stage at which it could be reviewed in the ordinary sense. The work is eminently one for the medical practitioner, since it treats most fully of those branches of physiology which have a direct bearing on the diagnosis and treatment of disease. The work is one which we can highly recommend to all our readers.—*Dublin Journal of Medical Sciences*, Feb. 1883.

Chapman's Human Physiology.

A Treatise on Human Physiology. By HENRY C. CHAPMAN, M.D., Professor of Institutes of Medicine in the Jefferson Medical College of Philadelphia. In one octavo volume of 925 pages, with 605 engravings. Cloth, $5.50; leather, $6.50.

Matters which have a practical bearing on the practice of medicine are lucidly expressed; technical matters are given in minute detail; elaborate directions are stated for the guidance of students in the laboratory. In every respect the work fulfils its promise, whether as a complete treatise for the student or for the physician; for the former it is so complete that he need look no farther, and the latter will find entertainment and instruction in an admirable book of reference.—*North Carolina Medical Journal*, Nov. 1887.

Physiology.

Cloth, $1.00. See *The Students' Quiz Series*, page 30.

Schofield's Elementary Physiology.—Just Ready.

Elementary Physiology for Students. By ALFRED T. SCHOFIELD, M.D., Late House Physician London Hospital. In one 12mo. volume of 380 pages, with 227 engravings and 2 colored plates containing 30 figures. Cloth, $2.00.

This volume is neither more nor less than its title implies. It is most skilfully put together and a vast deal of ground is covered. The language is clear and perspicuous, the arrangement is natural and consecutive. The illustrations are numerous and well executed. The book deserves to become popular.—*The Medical News*, July 1, 1893.

Frankland & Japp's Inorganic Chemistry.

Inorganic Chemistry. By E. FRANKLAND, D.C.L., F.R.S., Professor of Chemistry in the Normal School of Science, London, and F. R. JAPP, F.I.C., Assistant Professor of Chemistry in the Normal School of Science, London. In one handsome octavo volume of 677 pages, with 51 woodcuts and 2 plates. Cloth, $3.75; leather, $4.75.

This work should supersede other works of its class in the medical colleges. It is certainly better adapted than any work upon chemistry with which we are acquainted to impart that clear and full knowledge of the science which students of medicine should have. Physicians who feel that their chemical knowledge is behind the times would do well to study this work. The descriptions and demonstrations are made so plain that there is no difficulty in understanding them.—*Cincinnati Medical News*, January, 1886.

Clowes' Qualitative Analysis.—Third Edition.

An Elementary Treatise on Practical Chemistry and Qualitative Inorganic Analysis. Specially adapted for use in the Laboratories of Schools and Colleges and by Beginners. By FRANK CLOWES, D.Sc., London, Senior Science-Master at the High School, Newcastle-under-Lyme, etc. Third American from the fourth and revised English edition. In one 12mo. volume of 387 pages, with 55 illustrations. Cloth, $2.50.

CLASSEN'S ELEMENTARY QUANTITATIVE ANALYSIS. Translated, with notes and additions, by EDGAR F. SMITH, Ph.D., Assistant Professor of Chemistry in the Towne Scientific School, University of Pennsylvania. In one 12mo. volume of 324 pages, with 36 illustrations. Cloth, $2.00.

Simon's Chemistry.—New (4th) Edition. Just Ready.

Manual of Chemistry. A Guide to Lectures and Laboratory work for Beginners in Chemistry. A Text-book specially adapted for Students of Pharmacy and Medicine. By W. Simon, Ph.D., M.D., Professor of Chemistry and Toxicology Coll. of Phys. and Surg., Baltimore; Professor of Chemistry in the Maryland College of Pharmacy. New (fourth) edition. In one 8vo. volume of 490 pages, with 44 woodcuts and 7 colored plates illustrating 56 of the most important chemical tests. Cloth, $3.25.

A work which rapidly passes to its fourth edition needs no further proof of having achieved a success. In the present case the claims to favor are obvious. Emanating from an experienced teacher of medical and pharmaceutical students the volume is closely adapted to their needs. This is shown not only by the careful selection and clear presentation of its subject matter, but by the colored plates of reactions, which form a unique feature. Every teacher will appreciate the saving of his own time, and the advantages accruing to the student from a permanent and accurate standard of comparison for tests depending on colors, and frequently upon their changes. To the practitioner, who is likely to be confronted at any time with important pathological or toxicological questions to be answered by the test-tube, the volume will be of the utmost value. Such it has proved in the past, and the author has accordingly been enabled, through frequent and thorough revisions to keep his work constantly in touch with the progress of its science and the best methods of its presentation.—*Pacific Record of Medicine and Surgery*, Nov. 15, 1893.

The appearance within a year of another (the fourth) edition of Professor Simon's work indicates that our favorable opinion of the work as already expressed is shared both by teachers and students. The unique feature of representing color-reactions and colored precipitates by artistically-produced illustrations is attractive and cannot fail to become part of an object lesson, so necessary for the successful study of chemistry. It can be said to rank with the best text-books on pharmaceutic and medical chemistry in this country.—*The Medical News*, July 22, 1893.

Fownes' Chemistry.—Twelfth Edition.

A Manual of Elementary Chemistry; Theoretical and Practical. By George Fownes, Ph.D. Embodying Watts' *Physical and Inorganic Chemistry*. From the twelfth English edition. In one large 12mo. volume of 1061 pages, with 168 engravings and a colored plate. Cloth, $2.75; leather, $3.25.

Fownes' *Chemistry* has been a standard text-book upon chemistry for many years. Its merits are very fully known by chemists and physicians everywhere in this country and in England. As the science has advanced by the making of new discoveries, the work has been revised so as to keep it abreast of the times. It has steadily maintained its position as a text-book with medical students. In this work are treated fully: Heat, Light and Electricity, including Magnetism. The influence exerted by these forces in chemical action upon health and disease, etc., is of the most important kind, and should be familiar to every medical practitioner. We can commend the work as one of the very best text-books upon chemistry extant.—*Cincinnati Medical News*, Oct. 1885.

Attfield's Chemistry.—Twelfth Edition.

Chemistry, General, Medical and Pharmaceutical; Including the Chemistry of the U. S. Pharmacopœia. A Manual of the General Principles of the Science, and their Application to Medicine and Pharmacy. By John Attfield, M.A., Ph.D., F.I.C., F.R.S., etc., Professor of Practical Chemistry to the Pharmaceutical Society of Great Britain, etc. A new American, from the twelfth English edition, specially revised by the Author for America. In one handsome royal 12mo. volume of 782 pages, with 88 illustrations. Cloth, $2.75; leather, $3.25.

Attfield's *Chemistry* is the most popular book among students of medicine and pharmacy. This popularity rests upon real merits. Attfield's work combines in the happiest manner a clear exposition of the theory of chemistry with the practical application of this knowledge to the everyday dealings of the physician and pharmacist. His book is precisely what the title claims for it. The admirable arrangement of the text enables a reader to get a good idea of Chemistry without the aid of experiments, and again it is a good laboratory guide, and finally it contains such a mass of well-arranged information that it will always serve as a handy book of reference. He does not allow any unutilizable knowledge to slip into his book; his long years of experience have produced a work which is both scientific and practical, and which shuts out everything in the nature of a superfluity, and therein lies the secret of its success. This last edition shows the marks of the latest progress made in chemistry and chemical teaching.—*New Orleans Medical and Surgical Journal*, Nov. 1889.

Chemistry & Physics. Cloth, $1.00. See *Students' Quiz Series*, page 30.

Bloxam's Chemistry.—Fifth Edition.

Chemistry, Inorganic and Organic. By Charles L. Bloxam, Professor of Chemistry in King's College, London. From the fifth London edition, thoroughly revised and much improved. In one octavo volume of 727 pages, with 292 illustrations. Cloth, $2.00; leather, $3.00.

Comment from us on this standard work is almost superfluous. It differs widely in scope and aim from that of Attfield, and in its way is equally beyond criticism. It adopts the most direct methods in stating the principles, hypotheses and facts of the science. Its language is so terse and lucid, and its arrangement of matter so logical in sequence that the student never has occasion to complain that chemistry is a hard study. Much attention is paid to experimental illustrations of chemical principles and phenomena, and the mode of conducting these experiments. The book maintains the position it has always held as one of the best manuals of general chemistry in the English language.—*Detroit Lancet*, Feb. 1884.

Luff's Manual of Chemistry.—Just Ready.

A Manual of Chemistry. For the use of Students of Medicine. By Arthur P. Luff, M.D., B.Sc., Lecturer on Medical Jurisprudence and Toxicological Chemistry, St. Mary's Hospital Medical School, London. In one 12mo. volume of 522 pages, with 36 engravings. Cloth, $2.00. See *Students' Series of Manuals*, page 30.

Greene's Medical Chemistry.

A Manual of Medical Chemistry. For the use of Students. By William H. Greene, M.D., Demonstrator of Chemistry in the Medical Department of the University of Pennsylvania. In one 12mo. volume of 310 pages, with 74 illustrations. Cloth, $1.75.

Vaughan & Novy on Ptomaines and Leucomaines.—2d Ed.

Ptomaines, Leucomaines and Bacterial Proteids; or the Chemical Factors in the Causation of Disease. By VICTOR C. VAUGHAN, Ph.D., M.D., Professor of Physiological and Pathological Chemistry, and Associate Professor of Therapeutics and Materia Medica in the University of Michigan, and FREDERICK G. NOVY, M.D., Instructor in Hygiene and Physiological Chemistry in the University of Michigan. New (second) edition. In one 12mo. volume of 389 pages. Cloth, $2.25.

This book is one that is of the greatest importance, and the modern physician who accepts bacterial pathology cannot have a complete knowledge of this subject unless he has carefully perused it. To the toxicologist the subject is alike of great import, as well as to the hygienist and sanitarian. It contains information which is not easily obtained elsewhere, and which is of a kind that no medical thinker should be without.—*The American Journal of the Medical Sciences*, April, 1892.

This volume brings prominently to view the correct pathology of a host of diseases. Modern chemistry has furnished no more striking evidence of its value than the discovery of these ultimate causes of disease, a step which necessarily precedes any rational knowledge of cure or prevention. The literature of these subjects, already vast, was before the preparation of this work scattered and unattainable by those who had most need of its help, namely general practitioners. For the student no more important branch of chemistry exists. The early demand for a second edition of a work on so new a department of science argues well for the curriculum of those colleges which have already made it a branch of study and for the growing promptness on the part of the profession to recognize and use the most enlightened methods for the benefit of their patients.—*Southern Practitioner*, Dec. 1891.

Remsen's Theoretical Chemistry.—New (4th) Edition.

Principles of Theoretical Chemistry, with special reference to the Constitution of Chemical Compounds. By IRA REMSEN, M.D., Ph.D., Professor of Chemistry in the Johns Hopkins University, Baltimore. Fourth and thoroughly revised edition. In one royal 12mo. vol. of 325 pages. Cloth, $2.00.

The principles of theoretical chemistry need to be put very plainly to the student, for unless he gains a clear insight into the laws which govern the constitution of matter his idea of the whole subject is seldom sound, and he will probably lose the full benefit of a practical course. The book gives clear accounts of all theories and modern speculations. We have noticed this book favorably on a previous occasion, since which time four editions have been printed, and it has recently been translated into the German and Italian languages.—*London Lancet*, May 6, 1893.

The fourth edition of Professor Remsen's well-known book comes again, enlarged and revised. Each edition has enhanced its value. We may say without hesitation that it is a standard work on the theory of chemistry, not excelled and scarcely equalled by any other in any language. Its translation into German and Italian speaks for its exalted position and the esteem in which it is held by the most prominent chemists. We claim for this little work a leading place in the chemical literature of this country.—*The American Journal of the Medical Sciences*, July, 1893.

Charles' Physiological and Pathological Chemistry.

The Elements of Physiological and Pathological Chemistry. A Hand-book for Medical Students and Practitioners. Containing a general account of Nutrition, Foods and Digestion, and the Chemistry of the Tissues, Organs, Secretions and Excretions of the Body in Health and in Disease. Together with the methods for preparing or separating their chief constituents, as also for their examination in detail, and an outline syllabus of a practical course of instruction for students. By T. CRANSTOUN CHARLES, M.D., F.R.S., M.S., formerly Assistant Professor and Demonstrator of Chemistry and Chemical Physics, Queen's College, Belfast. In one handsome octavo volume of 463 pages, with 38 woodcuts and 1 colored plate. Cloth, $3.50.

Hoffmann and Powers' Analysis.

A Manual of Chemical Analysis, as applied to the Examination of Medicinal Chemicals and their Preparations. Being a Guide for the Determination of their Identity and Quality, and for the Detection of Impurities and Adulterations. For the use of Pharmacists, Physicians, Druggists and Manufacturing Chemists, and Pharmaceutical and Medical Students. By FREDERICK HOFFMANN, A.M., Ph.D., Public Analyst to the State of New York, and FREDERICK B. POWER, Ph.D., Professor of Analytical Chemistry in the Philadelphia College of Pharmacy. Third edition, entirely rewritten and much enlarged. In one octavo volume of 621 pages, with 179 illustrations. Cloth, $4.25.

Parrish's Pharmacy.—Fifth Edition.

A Treatise on Pharmacy: Designed as a Text-book for the Student, and as a Guide for the Physician and Pharmaceutist. With many Formulæ and Prescriptions. By EDWARD PARRISH, late Professor of the Theory of Practice of Pharmacy in the Philadelphia College of Pharmacy. Fifth edition, thoroughly revised, by THOMAS S. WIEGAND, Ph.G. In one handsome octavo volume of 1093 pages, with 256 illustrations. Cloth, $5.00; leather, $6.00.

No thorough-going pharmacist will fail to possess himself of so useful a guide to practice, and no physician who properly estimates the value of an accurate knowledge of the remedial agents employed by him in daily practice, so far as their miscibility, compatibility and most effective methods of combination are concerned, can afford to leave this work out of the list of their works of reference. The country practitioner, who must always be in a measure his own pharmacist, will find it indispensable.—*Louisville Medical News*, March 29, 1884.

Caspari's Pharmacy.—Preparing.

A Text-Book on Pharmacy. For Students and Pharmacists. By CHARLES CASPARI, JR., Ph.G., Profes-or of the Theory and Practice of Pharmacy in the Maryland College of Pharmacy, Baltimore. In one handsome octavo volume, thoroughly illustrated.

Ralfe's Clinical Chemistry.

Clinical Chemistry. By CHARLES H. RALFE, M.D., F.R.C.P., Assistant Physician at the London Hospital. In one pocket-size 12mo. volume of 314 pages, with 16 illustrations. Limp cloth, red edges, $1.50. See *Students' Series of Manuals*, page 30.

New (5th) Edition.—Just Ready.

The National Dispensatory.

CONTAINING THE NATURAL HISTORY, CHEMISTRY, PHARMACY, ACTIONS AND USES OF MEDICINES, INCLUDING THOSE RECOGNIZED IN THE PHARMACOPŒIAS OF THE UNITED STATES, GREAT BRITAIN AND GERMANY, WITH NUMEROUS REFERENCES TO THE FRENCH CODEX.

By ALFRED STILLÉ, M.D., LL.D.,
Professor Emeritus of the Theory and Practice of Medicine and of Clinical Medicine in the University of Penna.
JOHN M. MAISCH, Ph.M., Phar.D.,
Late Professor of Materia Medica and Botany in Phila. Coll. of Pharm., Secretary to the Amer. Pharm. Asso.
CHARLES CASPARI, Jr., Ph.G.,
Professor of Pharmacy in the Maryland College of Pharmacy, Baltimore.
And HENRY C. C. MAISCH., Ph.G., Ph.D.

New (fifth) edition thoroughly revised, according to the new United States Pharmacopœia (7th Decennial Revision, 1894). In one magnificent imperial octavo volume of 1910 pages, with 320 elaborate engravings. Cloth, $7.25; Leather, $8. With Ready Reference Thumb-letter Index, Cloth, $7.75; Leather, $8.50.

ON the first appearance of *The National Dispensatory* fifteen years ago it was at once recognized by the pharmaceutical and medical professions as satisfying the need for a work affording all necessary information upon its subject, with authoritative accuracy, and with a completeness and convenience attainable only by the exclusion of obsolete matter. Its success in filling this want is fully attested by the rapid demand for five editions, and the opportunity thus afforded has been well used in successive revisions, each placing it abreast of the day and maintaining the characteristics which had won for it a leading position.

Of all its issues the present embodies the results of the most exhaustive revision. The sweeping changes in the new United States Pharmacopœia are thoroughly incorporated, with official authorization of the Committee of Revision, and full use has been made of all valuable material in the latest issues of foreign Pharmacopœias. The volume is accordingly rich in pharmaceutical and chemical information, with data, formulas, tables, etc., gathered from all official sources, but this constitutes only a single department of its usefulness. As an encyclopedia of the latest and best therapeutical knowledge it deals not only with all official drugs, but also with all the new synthetic remedies of value and with the unofficial preparations now so largely in use. Pharmaceists will appreciate its systematic descriptions of the materia medica, its clear explanations of chemical and pharmaceutical processes and tests, and its illustrations of important drugs, and of the most improved apparatus. Physicians will readily perceive the indispensable assistance offered by its authoritative statements as to the efficacy of drugs in the light of the most recent medical advances. Arranged alphabetically in the text, this information is placed most suggestively at command by the recommendations grouped under the various Diseases in the Therapeutical Index. Together with the General Index this covers more than one hundred treble-columned pages containing 25,000 references. The immensity of detail comprised in this single volume of 1900 pages is thus most forcibly indicated. Though the present edition contains far more matter than its predecessors it is maintained at the same price in view of the ever-increasing demand. Weights and measures are given in both the Ordinary and Metric Systems.

In brief, the new edition of *The National Dispensatory* is presented to the medical and pharmaceutical professions as the equivalent of a whole library of pharmaceutical and therapeutic information; it is the standard for accuracy, the embodiment of completeness without inconvenient bulk, and a marvel of cheapness, owing to the widespread demand for it as *the* authority.

Maisch's Materia Medica.—Fifth Edition.

A Manual of Organic Materia Medica; Being a Guide to Materia Medica of the Vegetable and Animal Kingdoms. For the use of Students, Druggists, Pharmacists and Physicians. By JOHN M. MAISCH, Phar.D., Professor of Materia Medica and Botany in the Philadelphia College of Pharmacy. New (fifth) edition, thoroughly revised. In one very handsome 12mo. volume of 544 pages, with 270 engravings. Cloth, $3.00.

This is an excellent manual of organic materia medica, as are all the works that emanate from the skilful pen of such a successful teacher as John M. Maisch. The book speaks for itself in the most forcible language. In the edition before us, which is the fifth one published within the comparatively short space of eight years (and this is the best proof of the great value of the work and the just favor with which it has been received and accepted), the original contents have been thoroughly revised and much good and new matter has been incorporated. We have nothing but praise for Professor Maisch's work. It presents no weak point, even for the most severe critic. The book fully sustains the wide and well-earned reputation of its popular author. In the special line of work of which it treats it is fully up to the most recent observations and investigations. After a careful perusal of the book, we do not hesitate to recommend Maisch's *Manual of Organic Materia Medica* as one of the best, if not the best work on the subject thus far published. Its usefulness cannot well be dispensed with, and students, druggists, pharmacists, and physicians should all possess a copy of such a valuable book.—*Medical News*, December 31, 1892.

Edes' Therapeutics and Materia Medica.

A Text-Book of Therapeutics and Materia Medica. Intended for the Use of Students and Practitioners. By ROBERT T. EDES, M.D., Jackson Professor of Clinical Medicine in Harvard University. Octavo, 544 pages. Cloth, $3.50; leather, $4.50.

It possesses all the essentials which we expect in a book of its kind, such as conciseness, clearness, a judicious classification, and a reasonable degree of dogmatism. All the newest drugs of promise are treated of. The clinical index at the end will be found very useful. We heartily commend the book and congratulate the author on having produced so good a one.—*N. Y. Medical Journal*, Feb., 18, 1888.

Materia Medica and Therapeutics. Cloth, $1. See *The Students' Quiz Series*, p 30.

A System of Practical Therapeutics,

BY AMERICAN AND FOREIGN AUTHORS.

Edited by HOBART AMORY HARE, M.D.,

Professor of Therapeutics and Materia Medica in the Jefferson Medical College of Philadelphia.

In a series of contributions by seventy-eight eminent authorities. In three large octavo volumes of 3544 pages, with 434 illustrations. Price, per volume: Cloth, $5.00; leather, $6.00; half Russia, $7.00. *For sale by subscription only. Address the Publishers. Full prospectus free to any address on application.*

In treating of the employment of remedies and therapeutical measures, the writers have been singularly happy in giving in a definite way the exact methods employed and the results obtained, both by themselves and others, so that one might venture with confidence to use remedies with which he was previously entirely unfamiliar. The practitioner could hardly desire a book on practical therapeutics which he could consult with more interest and profit.—*The North American Practitioner*, September, 1892.

The scope of this work is beyond that of any previous one on the subject. The goal, after all, is the treatment of disease, and a work which contributes to its successful management is to be looked upon as of vast use to humanity. It cannot be denied that therapeutic resources, whether the treatment be confined to the mere administration of drugs, or allowed its more extended application to the management of disease, have so greatly multiplied within the last few years as to render previous treatises of little value. Herein will be found the great value of Hare's encyclopedic work, which groups together within a single series of volumes the most modern methods known in the management of disease, and especially deals with important subjects comprehensively, which could not be done in a more limited treatise. We cannot commend Hare's *System of Practical Therapeutics* too highly; it stands out first and foremost as a work to be consulted by authors, teachers and physicians throughout the world.—*Buffalo Medical and Surgical Journal*, August, 1892.

Hare's Text-Book of Practical Therapeutics.—New (3d) Ed.

A Text-Book of Practical Therapeutics; With Especial Reference to the Application of Remedial Measures to Disease and their Employment upon a Rational Basis. By HOBART AMORY HARE, M.D., Professor of Therapeutics and Materia Medica in the Jefferson Medical College of Philadelphia. With special chapters by DRS. G. E. DE SCHWEINITZ, EDWARD MARTIN, J. HOWARD REEVES, and BARTON C. HIRST. New (third) and revised edition. In one octavo volume of 689 pages. Cloth, $3.75; leather, $4.75. *Just Ready.*

Hare's works on Therapeutics are remarkably well known. The student of other works has often, indeed, very often, longed for less of the abstract materia medica and more of the practical application of drugs to disease. In this work that want is filled. The drugs are arranged alphabetically, which enables one to find any name quickly, and, with the excellent index at the end of the volume, naught is left to be desired in the way of quick reference. Each drug, including all the newer remedies which have been proved to possess true merit, is considered in a rational and scientific manner. This work also presents us with nearly 250 pages of practical therapeutics, as applied to the individual diseases. The subjects are arranged alphabetically. It is in the chapter on *Diseases* that the student finds the rationale of therapeutics. This section is properly the complement of the former, in which each drug was presented with notes as to its usefulness in numerous diseases, while in the latter each disease is considered very fully from a therapeutical stand-point, the applications and special indications for the different remedies in the different phases of that particular affection being given. It is not a wonder that this work was quickly adopted by many colleges as a text-book and so liberally purchased as to necessitate the publication of a third edition within two years; it is not surprising, but instead, just what we should reasonably expect. The student will find its pages filled with the choicest of therapeutical lore, systematically arranged and clearly and forcibly presented; the practitioner will appreciate its rationality and its general utility as an elbow consultant. It contains, without question, the best exposition of modern therapeutics of any text-book with which we are acquainted.—*The Chicago Clinical Review*, March, 1893.

Farquharson's Therapeutics and Materia Medica.—4th Ed.

A Guide to Therapeutics and Materia Medica. By ROBERT FARQUHARSON, M.D., F.R.C.P., LL.D., Lecturer on Materia Medica at St. Mary's Hospital Medical School, London. Fourth American, from the fourth English edition. Enlarged and adapted to the United States Pharmacopœia, by FRANK WOODBURY, M.D., Professor of Materia Medica and Therapeutics and Clinical Medicine in the Medico-Chirurgical College of Philadelphia. In one 12mo. volume of 581 pages. Cloth, $2.50.

Farquharson's *Therapeutics and Materia Medica* has struck a happy medium between excessive brevity on the one hand and tedious prolixity on the other. It deals with the entire list of drugs embraced in the *British Pharmacopœia* in such a way as to give in a satisfactory form the established indications of each, excluding all irrelevant matter. An especially attractive feature is an arrangement by which the physiological and therapeutical actions of various remedies are shown in parallel columns. This aids greatly in fixing attention and facilitates study. The American editor has enlarged the work so as to include all the remedies and preparations in the *United States Pharmacopœia*. Altogether the book is a most valuable addition to the list of treatises on this most important subject.—*The American Practitioner and News*, November 9, 1889.

Bruce's Materia Medica and Therapeutics.—Fifth Edition.

Materia Medica and Therapeutics. An Introduction to Rational Treatment. By J. MITCHELL BRUCE, M.D., F.R.C.P., Physician and Lecturer on Materia Medica and Therapeutics at Charing-Cross Hospital, London. Fifth edition. In one 12mo. volume of 591 pages. Cloth, $1.50. See *Students' Series of Manuals*, page 30.

BRUNTON'S TEXT-BOOK OF PHARMACOLOGY, THERAPEUTICS AND MATERIA MEDICA. Including the Pharmacy, the Physiological Action and the Therapeutical Uses of Drugs. By T. LAUDER BRUNTON, M.D., D.Sc., F.R.S., F.R.C.P., Lecturer on Materia Medica and Therapeutics at St. Bartholomew's Hospital, London, etc. Adapted to the United States Pharmacopœia by FRANCIS H. WILLIAMS, M.D., of Harvard University Medical School. Third edition. Octavo, 1305 pages, with 230 illustrations. Leather, $6.50.

STILLÉ'S THERAPEUTICS AND MATERIA MEDICA. A Systematic Treatise on the Action and Uses of Medicinal Agents, including their Description and History. Fourth edition, revised and enlarged. In two octavo volumes, containing 1936 pages. Cloth, $10.00; leather, $12.00.

HERMANN'S EXPERIMENTAL PHARMACOLOGY. A Handbook of Methods for Determining the Physiological Action of Drugs. Translated, with the Author's permission, and with extensive additions, by R. M. SMITH, M.D. 12mo., 199 pages, with 32 illustrations. Cloth, $1.50.

Flint's Practice of Medicine.—Sixth Edition.

A Treatise on the Principles and Practice of Medicine. Designed for the use of Students and Practitioners of Medicine. By AUSTIN FLINT, M.D., LL.D., Professor of the Principles and Practice of Medicine, and of Clinical Medicine in Bellevue Hospital Medical College, N. Y. Sixth edition, thoroughly revised and rewritten by the Author, assisted by WILLIAM H. WELCH, M.D., Professor of Pathology, Johns Hopkins University, Baltimore, and AUSTIN FLINT, JR., M.D., LL.D., Professor of Physiology, Bellevue Hospital Medical College, New York. In one very handsome octavo volume of 1160 pages, with illustrations. Cloth, $5.50; leather, $6.50.

No text-book on the principles and practice of medicine has ever met in this country with such general approval by medical students and practitioners as the work of Professor Flint. In all the medical colleges of the United States it is the favorite work upon Practice; and, as we have stated before in alluding to it, there is no other medical work that can be so generally found in the libraries of physicians. In every State and Territory of this vast country the book that will be most likely to be found in the office of a medical man, whether in city, town, village, or at some cross-roads, is Flint's *Practice*. We make this statement to a considerable extent from personal observation, and it is the testimony also of others. The work may undoubtedly be regarded as fairly representing the present state of the science of medicine, and as reflecting the views of those who exemplify in their practice the present stage of progress of medical art.—*Cincinnati Medical News*, October, 1886.

Fothergill's Handbook of Treatment.—Third Edition.

The Practitioner's Handbook of Treatment; Or, The Principles of Therapeutics. By J. MILNER FOTHERGILL, M.D., Edinburgh, M.R.C.P., London, Physician to the City of London Hospital for Diseases of the Chest. Third edition. In one 8vo. volume of 661 pages. Cloth, $3.75; leather, $4.75.

To have a description of the normal physiological processes of an organ and of the methods of treatment of its morbid conditions brought together in a single chapter, and the relations between the two clearly stated, cannot fail to prove a great convenience to many thoughtful but busy physicians. The practical value of the volume is greatly increased by the introduction of many prescriptions. That the profession appreciates that the author has undertaken an important work and has accomplished it is shown by the demand for this third edition.—*New York Medical Journal*, June 11, 1887.

The Year-Book of Treatment for 1894.—Ready Very Shortly.

A Comprehensive and Critical Review for Practitioners of Medicine and Surgery. In one 12mo. vol. of 500 pages. Cloth, $1.50. ****For special commutations with periodicals see pages 1 and 2.* A notice of the Year-Book for 1893 is appended.

The Year-Book of Treatment easily holds its advanced place among the many annuals and abstracts forming so marked a feature of modern medical literature. Its pages give a critical and well-arranged review of the best that the year has brought forth in all departments of therapeutics. Among so much that is excellent one can scarcely choose. Commendable features are the Summary of Therapeutics and the Selected List of New Books. There is as usual a good index.—*The Medical News*, May 20, 1893.

The Year-Books of Treatment for 1891 and 1892.

12mos., 485 pages. Cloth, $1.50 each.

The Year-Books of Treatment for 1886 and 1887.

Similar to above. 12mo., 320-341 pages. Cloth, $1.25 each.

Hartshorne's Essentials of Practice.—Fifth Edition.

Essentials of the Principles and Practice of Medicine. A Hand-book for Students and Practitioners. By HENRY HARTSHORNE, M.D., LL.D., lately Professor of Hygiene in the University of Pennsylvania. Fifth edition, thoroughly revised and rewritten. In one 12mo. volume of 669 pages, with 144 illustrations. Cloth, $2.75; half leather, $3.00.

Within the compass of 600 pages it treats of the history of medicine, general pathology, general symptomatology, and physical diagnosis (including laryngoscope, ophthalmoscope, etc.), general therapeutics, nosology, and special pathology and practice. There is a wonderful amount of information contained in this work, and it is one of the best of its kind that we have seen.—*Glasgow Medical Journal*, November, 1882.

Practice of Medicine, Including Nervous Diseases.

Cloth, $1.00. See *Students' Quiz Series*, page 30.

BRISTOWE'S PRACTICE OF MEDICINE. Seventh Edition. In one large octavo volume of 1325 pages. Cloth, $6.50; leather, $7.50.

REYNOLDS' SYSTEM OF MEDICINE. By J. RUSSELL REYNOLDS, M.D., Professor of the Principles and Practice of Medicine in University College, London. With notes and additions by HENRY HARTSHORNE, A.M., M.D., late Professor of Hygiene in the University of Pennsylvania. Three large octavo volumes, containing 3056 double-columned pages, with 317 illustrations. Price per volume, cloth, $5.00; sheep, $6.00; half Russia, raised bands, $6.50. Per set, cloth, $15.00; leather, $18.00; half Russia, $19.50. *Sold only by subscription.*

WATSON'S LECTURES ON THE PRINCIPLES AND PRACTICE OF PHYSIC. From the fifth English edition. Edited with additions, and 190 illustrations, by HENRY HARTSHORNE, A.M., M.D., late Professor of Hygiene in the University of Pennsylvania. In two large octavo volumes of 1840 pages. Cloth, $9.00; leather, $11.00.

FLINT ON PHTHISIS: ITS MORBID ANATOMY, ETIOLOGY, SYMPTOMATIC EVENTS AND COMPLICATIONS, FATALITY AND PROGNOSIS, TREATMENT AND PHYSICAL DIAGNOSIS; in a series of Clinical Studies. In one octavo volume of 442 pages. Cloth, $3.50.

FLINT'S PRACTICAL TREATISE ON THE DIAGNOSIS, PATHOLOGY AND TREATMENT OF DISEASES OF THE HEART. Second revised and enlarged edition. In one octavo volume of 550 pages, with a plate. Cloth, $4.

FLINT'S ESSAYS ON CONSERVATIVE MEDICINE AND KINDRED TOPICS. In one very handsome royal 12mo. volume of 210 pages. Cloth, $1.38.

STURGES' INTRODUCTION TO THE STUDY OF CLINICAL MEDICINE. Being a Guide to the Investigation of Disease. In one handsome 12mo. volume of 127 pages. Cloth, $1.25.

WALSHE ON THE DISEASES OF THE HEART AND GREAT VESSELS. Third American edition. In one octavo volume of 416 pages. Cloth, $3.00.

HOLLAND'S MEDICAL NOTES AND REFLECTIONS. One octavo volume of 493 pages. Cloth, $3.50.

Lyman's Practice of Medicine.

The Principles and Practice of Medicine. For the Use of Medical Students and Practitioners. By HENRY M. LYMAN, M.D., Professor of the Principles and Practice of Medicine, Rush Medical College, Chicago. In one octavo volume of 925 pages, with 170 illustrations. Cloth, $4.75; leather, $5.75.

This is an excellent treatise on the practice of medicine, written by one who is not only familiar with his subject, but who has also learned, through practical experience in teaching, what are the needs of the student, and how to present the facts to his mind in the most readily assimilable form. Each subject is taken up in order, treated clearly but briefly, and dismissed when all has been said that need be said in order to give the reader a clean-cut picture of the disease under discussion. The reader is not confused by having presented to him a variety of different methods of treatment, among which he is left to choose the one most easy of execution, but the author describes the one which is in his judgment the best. This is as it should be. What the student should be taught is the one most approved method of treatment. We have spoken of the work as one for the student, and this because the author occupies so prominent a position as a teacher, but we would not be understood that it is adapted only for students. He will find here each subject presented in its latest aspect, and only such theories mentioned as have been generally accepted by the highest authorities. The practical and busy man who wants to ascertain in a short time all the necessary facts concerning the pathology or treatment of any disease will find here a safe and convenient guide.—*Medical Record*, October 22, 1892.

Musser's Medical Diagnosis—Shortly.

A Practical Treatise on Medical Diagnosis. For the Use of Students and Practitioners. By JOHN H. MUSSER, M.D., Assistant Professor of Clinical Medicine, University of Pennsylvania, Philadelphia. In one octavo volume of about 900 pages, richly illustrated.

Great care has been bestowed on this book by its eminent author in the endeavor to make it a thorough explanation of a department of medicine which underlies the whole science of treatment. Everything pertaining to the diagnosis of disease—physical, rational, bacteriological—will here be found in the latest and most approved form. The work is one on which students and practitioners can confidently depend for an ample working knowledge of this fundamental branch of medicine.

Flint on Auscultation and Percussion.—Fifth Edition.

A Manual of Auscultation and Percussion; Of the Physical Diagnosis of Diseases of the Lungs and Heart, and of Thoracic Aneurism. By AUSTIN FLINT, M.D., LL.D., Professor of the Principles and Practice of Medicine in Bellevue Hospital Medical College, New York. Fifth edition. Edited by JAMES C. WILSON, M.D., Lecturer on Physical Diagnosis in the Jefferson Medical College, Philadelphia. In one handsome royal 12mo. volume of 274 pages, with 12 illustrations. Cloth, $1.75.

This little book through its various editions has probably done more to advance the science of physical exploration of the chest than any other dissertation upon the subject, and now in its fifth edition it is as nearly perfect as can be. The rapidity with which previous editions were sold shows how the profession appreciated the thoroughness of Professor Flint's investigations. For students it is excellent. Its value is shown both in the arrangement of the material and in the clear, concise style of expression. For the practitioner it is a ready manual for reference.—*North American Practitioner*, January, 1891.

Broadbent on the Pulse.

The Pulse. By W. H. BROADBENT, M.D., F.R.C.P., Physician to and Lecturer on Medicine at St. Mary's Hospital, London. In one 12mo. volume of 312 pages. Cloth, $1.75. See *Series of Clinical Manuals*, page 30.

Pepper's System of Practical Medicine.

BY AMERICAN AUTHORS.

Edited by WILLIAM PEPPER, M.D., LL.D.,

Provost and Professor of the Theory and Practice of Medicine and of Clinical Medicine in the University of Pennsylvania.

The complete work, in five volumes, containing 5573 pages, with 198 illustrations, is now ready. Price per volume, cloth, $5.00; leather, $6.00; half Russia, $7.00. *For sale by subscription only.*

Habershon on the Abdomen.

On the Diseases of the Abdomen; Comprising those of the Stomach, and other parts of the Alimentary Canal, Œsophagus, Cæcum, Intestines and Peritoneum. By S. O. HABERSHON, M.D., Senior Physician to and late Lecturer on Principles and Practice of Medicine at Guy's Hospital, London. Second American from third enlarged and revised English edition. In one handsome octavo volume of 554 pages, with illustrations. Cloth, $3.50.

FULLER ON DISEASES OF THE LUNGS AND AIR-PASSAGES. Their Pathology, Physical Diagnosis, Symptoms and Treatment. From the second and revised English edition. In one octavo volume of 475 pages. Cloth, $3.50.

SLADE ON DIPHTHERIA; its Nature and Treatment, with an account of the History of its Prevalence in various Countries. Second and revised edition. In one 12mo. vol., 158 pp. Cloth, $1.25

SMITH ON CONSUMPTION; its Early and Remediable Stages. 1 vol. 8vo., 253 pp. Cloth, $2.25.

LA ROCHE ON PNEUMONIA. 1 vol. 8vo., 490 pages. Cloth, $3.00.

WILLIAMS ON PULMONARY CONSUMPTION; its Nature, Varieties, and Treatment. With an analysis of one thousand cases to exemplify its duration. In one 8vo. vol. of 303 pp. Cloth, $2.50.

Whitla's Dictionary of Treatment.

A Dictionary of Treatment; or Therapeutic Index, including Medical and Surgical Therapeutics. By WILLIAM WHITLA, M.D., Professor of Materia Medica and Therapeutics in the Queen's College, Belfast. Revised and adapted to the United States Pharmacopœia. In one square, octavo volume of 917 pages. Cloth, $4.00.

The several diseased conditions are arranged in alphabetical order, and the methods, medical, surgical, dietetic and climatic, by which they may be met, are considered. On every page we find clear and detailed directions for treatment. The book abounds with useful, practical hints and suggestions. The most experienced members of the profession may usefully consult its pages for the purpose of learning what is really trustworthy in the later therapeutic developments. The *Dictionary*, is, in short, the recorded experience of a practical scientific therapeutist, who has carefully studied diseases and disorders at the bed-side and in the consulting-room, and has earnestly addressed himself to the cure and relief of his patients. *The Glasgow Medical Journal*, April, 1892.

Bartholow on Cholera.—Just Ready.

Cholera: Its Causes, Symptoms, Pathology and Treatment. By ROBERTS BARTHOLOW, M.D., LL.D., Emeritus Professor of Materia Medica, General Therapeutics and Hygiene in the Jefferson Medical College of Philadelphia. In one 12mo. volume of 127 pages, with 9 illustrations. Cloth, $1.25.

Dr. Bartholow has produced a little book on cholera at once authoritative and complete in its detail. He has shown how all that is absolutely necessary for the practitioner to know about cholera may be compressed into a few pages. Nearly one half the book is given to treatment.—*Journal of the American Medical Association*, July 15, 1893.

We have here a practical book, in small compass, containing the very latest ideas concerning the treatment of cholera, together with the personal experience of the author who has passed through two epidemics of this disease. Historical accounts and long discussions on disputed etiological points are omitted and only that which is of most use to the general practitioner is included.—*The National Medical Review*, August, 1893.

BY THE SAME AUTHOR.

Medical Electricity. A Practical Treatise on the Applications of Electricity to Medicine and Surgery. Third edition. In one octavo volume of 308 pages, with 110 illustrations. Cloth, $2.50.

Professor Bartholow's practical treatise on the applications of electricity to medicine and surgery, having reached a third edition, scarcely requires detailed notice. Originally intended for students and practitioners, it starts by assuming an "entire unacquaintance with the elements of the subject." The work is fitted by its extreme lucidity for the use of busy practitioners who require a guide in practical electro-therapeutics. — *London Lancet*, January 14, 1888.

Yeo's Manual of Medical Treatment.—Just Ready.

A Manual of Medical Treatment or Clinical Therapeutics. By I. BURNEY YEO, M.D., F.R.C.P., Professor of Therapeutics in King's College London. In two 12mo. volumes containing 1275 pages, with illustrations. Complete work, cloth, $5.50.

Whether for the teacher or practitioner, this *Manual* is a most serviceable one. It teaches therapeutics from the standpoint of indications of treatment. It necessarily therefore discusses the character of the diseases, which helps wonderfully in an appreciation of the remedies advised in a given case. The work is not intended as simply for ready reference, although, in an emergency, many valuable prescriptions may be copied from its pages. It is rather intended to stimulate the reader to a study of the principles of therapeutics, while the well-chosen prescriptions on almost every page are intended chiefly to serve as illustrations of the principles of the text. We most cordially recommend the *Manual* under notice to the favorable consideration of every practitioner of medicine who seeks to prescribe scientifically and for the good of the patient.—*Virginia Medical Monthly*, October, 1893.

BY THE SAME AUTHOR.

Food in Health and Disease. In one 12mo. volume of 590 pages. Cloth, $2.00. See *Series of Clinical Manuals*, page 30.

Dr. Yeo supplies in a compact form nearly all that the practitioner requires to know on the subject of diet. The work is divided into two parts—food in health and food in disease. Dr. Yeo has gathered together from all quarters an immense amount of useful information within a comparatively small compass, and he has arranged and digested his materials with skill for the use of the practitioner. We have seldom seen a book which more thoroughly realizes the object for which it was written than this little work of Dr. Yeo.—*British Medical Journal*, February 8, 1890.

Richardson's Preventive Medicine.

Preventive Medicine. By B. W. RICHARDSON, M.D., LL.D., F.R.S., Fellow of the Royal College of Physicians, London. In one 8vo. volume of 729 pages. Cloth, $4.00; leather, $5.00.

SCHREIBER ON MASSAGE. A Manual of Treatment by Massage and Methodical Muscle Exercise. By JOSEPH SCHREIBER, M.D. Translated by WALTER MENDELSON, M.D., of New York. In one handsome octavo volume of 271 pages, with 117 fine engravings.

STILLÉ ON CHOLERA: Its Origin, History, Causation, Symptoms, Lesions, Prevention and Treatment. In one handsome 12mo. vol. of 163 pages, with a chart. Cloth, $1.25.

PAVY'S TREATISE ON THE FUNCTION OF DIGESTION; its Disorders and their Treatment. From the second London edition. In one octavo volume of 238 pages. Cloth, $2.00.

BARLOW'S MANUAL OF THE PRACTICE OF MEDICINE. With additions by D. F. CONDIE, M.D. In one octavo volume of 603 pages. Cloth, $2.50.

CHAMBERS' MANUAL OF DIET AND REGIMEN IN HEALTH AND SICKNESS. In one handsome octavo volume of 302 pages. Cloth, $2.75.

A TREATISE ON FEVER. By ROBERT D. LYONS, K.C.C. In one octavo volume of 351 pages. Cloth, $2.25.

LECTURES ON THE STUDY OF FEVER. By A. HUDSON, M.D., M.R.I.A. In one octavo volume of 308 pages. Cloth, $2.50.

LA ROCHE ON YELLOW FEVER, in its Historical, Pathological, Etiological and Therapeutical Relations. Two octavo volumes, 1168 pages. Cloth, $7.00.

TANNER'S MANUAL OF CLINICAL MEDICINE AND PHYSICAL DIAGNOSIS. Third American, from the second London edition. Revised and enlarged by TILBURY FOX, M.D. In one 12mo. volume of 362 pages, with illustrations. Cloth, $1.50.

DAVIS' CLINICAL LECTURES ON VARIOUS IMPORTANT DISEASES. By N. S. DAVIS, M.D. Edited by FRANK H. DAVIS, M.D. Second edition. 12mo., 287 pages. Cloth, $1.75.

TODD'S CLINICAL LECTURES ON CERTAIN ACUTE DISEASES. In one 8vo. volume of 320 pages. Cloth, $2.50.

FLINT'S PRACTICAL TREATISE ON THE PHYSICAL EXPLORATION OF THE CHEST AND THE DIAGNOSIS OF DISEASES AFFECTING THE RESPIRATORY ORGANS. Second and revised edition. In one handsome octavo volume of 591 pages. Cloth, $4.50.

Gray on Nervous and Mental Diseases.—Just Ready.

A Practical Treatise on Nervous and Mental Diseases. By LANDON CARTER GRAY, M.D., Professor of Diseases of the Mind and Nervous System in the New York Polyclinic. In one very handsome octavo volume of 681 pages, with 168 illustrations. Cloth, $4.50; leather, $5.50.

This book combines the closely allied subjects of nervous and mental diseases, and treats them as clinical morbid conditions rather than as speculative entities. It appeals very strongly to the practical physician, its guiding principle being to give him a basis for definite treatment. The profession has accepted him at his word, and gladly welcomes his book as an epitome of the latest clinical views on subjects hitherto treated from an entirely too speculative and theoretical point of view. His chapters on functional neuroses are full of excellent suggestions, and his article on neurasthenia is to be especially commended. On this most important phase of nervous exhaustion Gray covers twenty-five pages. His views as to causation and his therapeutic suggestions are unexcelled.—*Pacific Medical Journal*, November, 1893.

This fresh work upon nervous diseases will receive a warm welcome. The author is well known as an authority upon neurological subjects, and this treatise, the result of much labor, painstaking research and acute observation will be found a most useful volume for the student and practitioner. The physician will find it an invaluable work of reference in which everything relating to the subject may be found in an attractive form.—*Nashville Journal of Medicine and Surgery*, November, 1893.

Ross on Diseases of the Nervous System.

A Hand-book on Diseases of the Nervous System. By JAMES ROSS, M.D., F.R.C.P., LL.D., Senior Assistant Physician to the Manchester Royal Infirmary. In one octavo volume of 725 pages, with 184 illustrations. Cloth, $4.50; leather, $5.50.

This admirable work is intended for students of medicine and for such medical men as have no time for lengthy treatises. In the present instance the duty of arranging the vast store of material at the disposal of the author, and of abridging the description of the different aspects of nervous diseases, has been performed with singular skill, and the result is a concise and philosophical guide to the department of medicine of which it treats. Dr. Ross holds such a high scientific position that any writings which bear his name are naturally expected to have the impress of a powerful intellect. In every part this handbook merits the highest praise, and will no doubt be found of the greatest value to the student as well as to the practitioner.—*Edinburgh Medical Journal*, January, 1887.

Hamilton on Nervous Diseases.—Second Edition.

Nervous Diseases; Their Description and Treatment. By ALLAN MCLANE HAMILTON, M.D., Attending Physician at the Hospital for Epileptics and Paralytics, Blackwell's Island, N. Y. Second edition, thoroughly revised and rewritten. In one octavo volume of 598 pages, with 72 illustrations. Cloth, $4.00.

Savage on Insanity and Allied Neuroses.

Insanity and Allied Neuroses, Practical and Clinical. By GEORGE H. SAVAGE, M.D., Lecturer on Mental Diseases at Guy's Hospital, London. In one 12mo. volume of 551 pages, with 18 illustrations. Cloth, $2.00. See *Series of Clinical Manuals*, page 30.

Tuke on the Influence of the Mind upon the Body.

Illustrations of the Influence of the Mind Upon the Body in Health and Disease. Designed to elucidate the Action of the Imagination. By DANIEL HACK TUKE, M.D., Joint Author of the Manual of Psychological Medicine, etc. New edition, thoroughly revised and rewritten. In one 8vo. volume of 467 pages, with 2 colored plates. Cloth, $3.00.

Guided by an enlightened deduction, the author has reclaimed for science a most interesting domain in psychology, previously abandoned to charlatans and empirics. This book, well conceived and well written, must commend itself to every thoughtful understanding.—*New York Medical Journal*, September 6, 1884.

Clouston on Mental Diseases.

Clinical Lectures on Mental Diseases. By THOMAS S. CLOUSTON, M.D., Lecturer on Mental Diseases in the University of Edinburgh. With an Appendix, containing an abstract of the Statutes of the United States and of the Several States and Territories relating to the Custody of the Insane. By CHARLES F. FOLSOM, M.D., Assistant Professor of Mental Diseases, Medical Department of Harvard University. In one octavo volume of 541 pages, with 8 lithographic plates, 4 of which are colored. Cloth, $4.00.

☞Dr. Folsom's *Abstract* also separate, in one 8vo. volume of 108 pages. Cloth, $1.50.

The descriptions of the diseases and cases are simple and practical, but true; and one sees as he reads that they are given by one perfectly familiar from daily observation with the cases and diseases he is speaking of. One feature of the book which commends it highly, and which is not to be found in any other work on mental diseases, are the hints and descriptions given as to the practical management and care of the cases. We can heartily recommend it to the student and busy general practitioner. Dr. Folsom's work greatly increases the value of Dr. Clouston's book for the American practitioner.—*Archives of Medicine*, June, 1884.

Playfair on Nerve Prostration and Hysteria.

The Systematic Treatment of Nerve Prostration and Hysteria. By W. S. PLAYFAIR, M.D., F.R.C.P. In one 12mo. volume of 97 pages. Cloth, $1.00.

BLANDFORD ON INSANITY AND ITS TREATMENT. Lectures on the Treatment, Medical and Legal, of Insane Patients. In one very handsome octave volume.

JONES' CLINICAL OBSERVATIONS ON FUNCTIONAL NERVOUS DISORDERS. Second American edition. In one handsome octavo volume of 340 pages. Cloth, $3.25.

Gibbes' Practical Pathology and Morbid Histology.

Practical Pathology and Morbid Histology. By HENEAGE GIBBES, M.D., Professor of Pathology in the University of Michigan, Medical Department. In one very handsome 8vo. volume of 314 pages, with 60 illustrations, mostly photographic. Cloth, $2.75.

This is, in part, an expansion of the little work published by the author some years ago, and his acknowledged skill as a practical microscopist will give weight to his instructions. Indeed, in fullness of directions as to the modes of investigating morbid tissues, the book leaves little to be desired. The work is throughout profusely illustrated with reproductions of micro-photographs. We may say that the practical histologist will gain much useful information from the book.—*The London Lancet*, January 23, 1892.

Abbott's Bacteriology.

The Principles of Bacteriology: a Practical Manual for Students and Physicians. By A. C. ABBOTT, M.D., First Assistant, Laboratory of Hygiene, University of Pennsylvania, Philadelphia. In one 12mo. volume of 259 pages, with 32 illustrations. Cloth, $2.00.

To a person desiring to learn the technique of bacteriological work, we cannot recommend any work which will be more suitable than the one before us. Dr. Abbott has shown great judgment in the selection and arrangement of his material. The student who follows it closely will be in a condition to carry forward the work for himself. Medical practitioners generally could read the work with profit, especially the chapters on sterilization and disinfection and those on tuberculosis and diphtheria in the second part.—*The Canadian Practitioner*, Nov. 1, 1892.

Senn's Surgical Bacteriology.—Second Edition.

Surgical Bacteriology. By NICHOLAS SENN, M.D., Ph.D., Professor of Surgery in Rush Medical College, Chicago. New (second) edition. In one handsome octavo volume of 268 pages, with 13 plates, of which 10 are colored, and 9 engravings. Cloth, $2.00.

The book is really a systematic collection in the most concise form of such results as are published in current medical literature by the ablest workers in this field of surgical progress; and to these are added the author's own views and the results of his clinical experience and original investigations. The book is valuable to the student, but its chief value lies in the fact that such a compilation makes it possible for the busy practitioner, whose time for reading is limited and whose sources of information are often few, to become conversant with the most modern and advanced ideas in surgical pathology, which have "laid the foundation for the wonderful achievements of modern surgery."—*Annals of Surgery*, March, 1892.

Green's Pathology and Morbid Anatomy.—Seventh Edition.

Pathology and Morbid Anatomy. By T. HENRY GREEN, M.D., Lecturer on Pathology and Morbid Anatomy at Charing-Cross Hospital Medical School, London. Sixth American from the seventh and revised English edition. Octavo volume of 539 pages, with 167 engravings. Cloth, $2.75.

There is scarcely an intelligent physician anywhere who has not the work in his library, for it is almost an essential. In fact it is better adapted to the wants of general practitioners than any work of the kind with which we are acquainted. The works of German authors upon pathology, which have been translated into English, are too abstruse for the physician. Dr. Green's work precisely meets his wishes. The fact that it is so generally employed as a text-book by medical students is evidence that we have not spoken too much in its favor.—*Cincinnati Medical News*, October, 1889.

Payne's General Pathology.

A Manual of General Pathology. Designed as an Introduction to the Practice of Medicine. By JOSEPH F. PAYNE, M.D., F.R.C.P., Lecturer on Pathological Anatomy, St. Thomas' Hospital, London. Octavo volume of 524 pages, with 152 illustrations and a colored plate. Cloth, $3.50.

Knowing, as a teacher and examiner, the exact needs of medical students, the author has in the work before us prepared for their especial use what we do not hesitate to say is the best introduction to general pathology that we have yet examined. A departure which our author has taken is the greater attention paid to the causation of disease, and more especially to the etiological factors in those diseases now with reasonable certainty ascribed to pathogenetic microbes. In this department he has been very full and explicit, not only in a descriptive manner, but in the technique of investigation. The Appendix, giving methods of research, is alone worth the price of the book, several times over, to every student of pathology.—*St. Louis Medical and Surgical Journal*, January, 1889.

Coats' Treatise on Pathology.

A Treatise on Pathology. By JOSEPH COATS, M.D., F.F.P.S., Pathologist to the Glasgow Western Infirmary. In one octavo volume of 829 pages, with 339 illustrations. Cloth, $5.50; leather, $6.50.

We are very much pleased with this book, which, for general practitioners and students, comes nearer to our idea of perfection than any we know on this subject, within the same dimensions. The style is exceedingly good, being plain, concise and practical. We have pleasure in recommending it to students, as we think it well adapted for their use.—*Canadian Practitioner*, December, 1883.

Klein's Histology.—Fourth Edition.

Elements of Histology. By E. KLEIN, M.D., F.R.S., Joint Lecturer on General Anatomy and Physiology in the Medical School of St. Bartholomew's Hospital, London. Fourth edition. In one 12mo. volume of 376 pages, with 194 illus. Limp cloth, $1.75. See *Students' Series of Manuals*, page 30.

The large number of editions through which Dr. Klein's little handbook of histology has run since its first appearance in 1883 is ample evidence that it is appreciated by the medical student and that it supplies a definite want. The clear and concise manner in which it is written, the absence of debatable matter, of conflicting views, and the convenient size of the book and its moderate price, will account for its undoubted success.—*Medical Chronicle*, Feb., 1890.

Histology, Pathology and Bacteriology. Cloth. $1. See *Students' Quiz Series*, p. 30.

Ashhurst's Surgery.—New (Sixth) Edition. Just Ready.

The Principles and Practice of Surgery. By JOHN ASHHURST, JR., M.D., Barton Professor of Surgery and Clinical Surgery in the University of Pennsylvania, Surgeon to the Pennsylvania Hospital, Philadelphia. New (6th) edition, enlarged and thoroughly revised. In one octavo volume of 1161 pages, with 656 illustrations. Cloth, $6.00; leather, $7.00.

This concise work treats in the most compact form compatible with clearness of the modern methods employed in the management of surgical affections. The principles upon which these directions are based are clearly stated, and definite reasons given for the course recommended. The popularity of this work is demonstrated by the fact that a sixth edition has become necessary, and the author has spared no pains to incorporate in it all the more recent discoveries and practical advances which have been made in surgical science. A new chapter has been introduced on Surgical Bacteriology. The series of illustrations has been enriched by the addition of a number of original cuts and of a colored plate illustrating bacteriological subjects. The work is thoroughly in touch with the times, and deals with each subject in a manner characteristic of the author. Nothing is left unsaid which would add to the practical usefulness of the book.—*The International Magazine*, December, 1893.

Roberts' Modern Surgery.

The Principles and Practice of Modern Surgery. For the use of Students and Practitioners of Medicine and Surgery. By JOHN B. ROBERTS, M.D., Professor of Anatomy and Surgery in the Philadelphia Polyclinic. Professor of the Principles and Practice of Surgery in the Woman's Medical College of Pennsylvania. Lecturer on Anatomy in the University of Pennsylvania. In one very handsome octavo volume of 780 pages, with 501 illustrations. Cloth, $4.50; leather, $5.50.

This work is a very comprehensive manual upon general surgery, and will doubtless meet with a favorable reception by the profession. It has a thoroughly practical character, the subjects are treated with rare judgment, its conclusions are in accord with those of the leading practitioners of the art, and its literature is fully up to all the advanced doctrines and methods of practice of the present day. Its general arrangement follows this rule, and the author, in his desire to be concise and practical, is at times almost dogmatic, but this is entirely excusable considering the admirable manner in which he has thus increased the usefulness of his work.—*Medical Record*, January 17, 1891.

Druitt's Modern Surgery.—Twelfth Edition.

Manual of Modern Surgery. By ROBERT DRUITT, M.R.C.S. Twelfth edition, thoroughly revised by STANLEY BOYD, M.B., B.S., F.R.C.S. In one 8vo. volume of 965 pages, with 373 illustrations. Cloth, $4.00; leather, $5.00.

Druitt's *Surgery* has been an exceedingly popular work in the profession. It is stated that 50,000 copies have been sold in England, while in the United States, ever since its first issue, it has been used as a text-book to a very large extent. During the late war in this country it was so highly appreciated that a copy was issued by the Government to each surgeon. The present edition, while it has the same features peculiar to the work at first, embodies all recent discoveries in surgery, and is fully up to the times. —*Cincinnati Medical News*, September, 1887.

Surgery. Cloth, $1.75. See *Students' Quiz Series*, page 30.

Young's Orthopædic Surgery.—In Press.

A Manual of Orthopædic Surgery, for Students and Practitioners. By JAMES K. YOUNG, M.D., Instructor in Orthopædic Surgery, University of Pennsylvania, Philadelphia. In one 12mo. volume of about 400 pages, fully illustrated.

Sutton on Tumors, Innocent and Malignant.—Just Ready.

Tumors, Innocent and Malignant. Their Clinical Features and Appropriate Treatment. By J. BLAND SUTTON, F.R.C.S., Assistant Surgeon to the Middlesex Hospital, London. In one very handsome octavo volume of 526 pages, with 250 engravings and 9 full page plates. Cloth, $4.50.

Butlin on the Tongue.

Diseases of the Tongue. By HENRY T. BUTLIN, F.R.C.S., Assistant Surgeon to St. Bartholomew's Hospital, London. In one 12mo. volume of 456 pages, with 8 colored plates and 3 woodcuts. Cloth, $3.50. See *Series of Clinical Manuals*, page 30.

Gould's Surgical Diagnosis.

Elements of Surgical Diagnosis. By A. PEARCE GOULD, M.S., M.B., F.R.C.S., Assistant Surgeon to Middlesex Hospital, London. In one pocket-size 12mo. volume of 589 pages. Cloth, $2.00. See *Students' Series of Manuals*, page 30.

Schafer's Histology.—Third Edition.

The Essentials of Histology. By EDWARD A. SCHAFER, M.D., F.R.S., Jodrell Professor of Physiology in University College, London. New (third) edition. In one octavo volume of 311 pages, with 325 illustrations. Cloth, $3.00.

PEPPER'S SURGICAL PATHOLOGY. In one pocket-size 12mo. volume of 541 pages, with 81 illustrations. Limp cloth, red edges, $2.00. See *Students' Series of Manuals*, page 30.

PIRRIE'S PRINCIPLES AND PRACTICE OF SURGERY. Edited by JOHN NEILL, M.D. In one octavo volume of 784 pages, with 316 illustrations. Cloth, $3.75.

GANT'S STUDENT'S SURGERY. By FREDERICK JAMES GANT, F.R.C.S. Square octavo, 848 pages, 159 engravings. Cloth, $3.75.

MILLER'S PRACTICE OF SURGERY. Fourth and revised American edition. In one large octavo volume of 682 pages, with 364 illustrations. Cloth, $3.75.

MILLER'S PRINCIPLES OF SURGERY. Fourth American from the third Edinburgh edition. In one octavo volume of 638 pages, with 340 illustrations. Cloth, $3.75.

Erichsen's Science and Art of Surgery.—Eighth Edition.

The Science and Art of Surgery; Being a Treatise on Surgical Injuries, Diseases and Operations. By JOHN E. ERICHSEN, F.R.S., F.R.C.S., Professor of Surgery in the University College, London, etc. From the eighth and enlarged English edition. In two large octavo volumes of 2316 pages, with 984 engravings on wood. Cloth, $9.00; leather, $11.00.

For many years this classic work has been made by preference of teachers the principal text-book on surgery for medical students, while through translations into the leading continental languages it may be said to guide the surgical teachings of the civilized world. No excellence of the former edition has been dropped and no discovery, device or improvement which has marked the progress of surgery during the last decade has been omitted. The illustrations are many and executed in the highest style of art.—*Louisville Medical News*, February 14, 1885.

Bryant's Practice of Surgery.—Fourth Edition.

The Practice of Surgery. By THOMAS BRYANT, F.R.C.S., Surgeon and Lecturer on Surgery at Guy's Hospital, London. Fourth American from the fourth and revised English edition. In one large imperial octavo volume of 1040 pages, with 727 illustrations. Cloth, $6.50; leather, $7.50.

The fourth edition of this work is fully abreast of the times. The author handles his subjects with that degree of judgment and skill which is attained by years of patient toil and varied experience. The present edition is a thorough revision of those which preceded it, with much new matter added. His diction is so graceful and logical, and his explanations are so lucid, as to place the work among the highest order of text-books for the medical student. Almost every topic in surgery is presented in such a form as to enable the busy practitioner to review any subject in every-day practice in a short time. No time is lost with useless theories or superfluous verbiage. In short, the work is eminently clear, logical and practical.—*Chicago Medical Journal and Examiner*, April, 1886.

Wharton's Minor Surgery and Bandaging.—New (2d) Ed.

Minor Surgery and Bandaging. By HENRY R. WHARTON, M.D., Demonstrator of Surgery in the University of Pennsylvania. In one 12mo. volume of 529 pages, with 416 engravings, many being photographic. Cloth, $3.00. *Just ready.*

In this new edition of Dr. Wharton's *Minor Surgery and Bandaging* the treatment of wounds by the aseptic and antiseptic methods has been thoroughly revised and a considerable amount of new material added, together with a number of new illustrations. The application of all the bandages used in surgery is carefully described and neatly illustrated by photographs taken from life. Throughout the book the author has said what he has to say in as few words as possible, and illustrated the text very copiously with excellent illustrations. No book on minor surgery with which we are familiar appeals so strongly, not only to the student of medicine, on account of its eminently practical nature, but also to the general practitioner, on account of the excellent advice embodied in its pages.—*International Medical Magazine*, December, 1893.

Treves' Operative Surgery.—Two Volumes.

A Manual of Operative Surgery. By FREDERICK TREVES, F.R.C.S., Surgeon and Lecturer on Anatomy at the London Hospital. In two octavo volumes containing 1550 pages, with 422 engravings. Complete work, cloth, $9.00; leather, $11.00.

Mr. Treves in this admirable manual of operative surgery has in each instance practically assumed that operation has been decided upon and has then proceeded to give the various operative methods which may be employed, with a criticism of their comparative value and a detailed and careful description of each particular stage of their performance. Especial attention has been paid to the preparatory treatment of the patient and to the details of the after-treatment of the case, and this is one of the most distinctive among the many excellent features of the book. We declare it the best work on the subject in the English language, and indeed, in many respects, the best in any language. It cannot fail to be of the greatest use both to practical surgeons and to those general practitioners who, owing to their isolation or to other circumstances, are forced to do much of their own operative work. We recommend the book so strongly for the excellent judgment displayed in the arduous task of selecting from among the thousands of varying procedures those most worthy of description; for the way in which the still more difficult task of choosing among the best of those has been accomplished; and for the simple, clear, straightforward manner in which the information thus gathered from all surgical literature has been conveyed to the reader.—*Annals of Surgery*, March, 1892.

Treves' Student's Hand-Book of Surgical Operations. In one square 12mo. volume of 508 pages, with 94 illustrations. Cloth, $2.50.

A Manual of Surgery. In Treatises by various Authors, edited by FREDERICK TREVES, F.R.C.S. In three 12mo. volumes, containing 1866 pages, with 213 engravings. Price per set, cloth, $6.00. See *Students' Series of Manuals*, page 30.

We have here the opinions of thirty-three authors, in an encyclopædic form for easy and ready reference. The three volumes embrace every variety of surgical affections likely to be met with, the paragraphs are short and pithy, and the salient points and the beginnings of new subjects are always printed in extra-heavy type, so that a person may find whatever information he may be in need of at a moment's glance.—*Cincinnati Lancet-Clinic*, August 21, 1886.

Treves on Intestinal Obstruction. In one 12mo. volume of 522 pages, with 60 illustrations. Limp cloth, blue edges, $2.00. See *Series of Clinical Manuals*, page 30.

Holmes' System of Surgery.—American Edition.

A System of Surgery; Theoretical and Practical. IN TREATISES BY VARIOUS AUTHORS. Edited by TIMOTHY HOLMES, M.A., Surgeon and Lecturer on Surgery at St. George's Hospital, London. AMERICAN EDITION, THOROUGHLY REVISED AND RE-EDITED by JOHN H. PACKARD, M.D. Three large octavo volumes of 3137 pages, with 979 illustrations on wood and 13 lithographic plates. Per set, cloth, $18.00; leather, $21.00. *Subscription only.*

Smith's Operative Surgery.—Revised Edition.

The Principles and Practice of Operative Surgery. By STEPHEN SMITH, M.D., Professor of Clinical Surgery in the University of the City of New York. Second and thoroughly revised edition. In one very handsome octavo volume of 892 pages, with 1005 illustrations. Cloth, $4.00; leather, $5.00.

This excellent and very valuable book is one of the most satisfactory works on modern operative surgery yet published. The book is a compendium for the modern surgeon. The present edition is much enlarged, and the text has been thoroughly revised, so as to give the most improved methods in aseptic surgery and the latest instruments known for operative work. It can be truly said that, as a handbook for the student, a companion for the surgeon, and even as a book of reference for the physician not especially engaged in the practice of surgery, this volume will long hold a most conspicuous place, and seldom will its readers, no matter how unusual the subject, consult its pages in vain. Its compact form, excellent print, numerous illustrations, and especially its decidedly practical character, all combine to commend it.—*Boston Medical and Surgical Journal*, May 10, 1888.

Holmes' Treatise on Surgery.—One Volume. Fifth Edition.

A Treatise on Surgery; Its Principles and Practice. By TIMOTHY HOLMES, M.A., Surgeon and Lecturer on Surgery at St. George's Hospital London. From the fifth English edition, edited by T. PICKERING PICK, F.R.C.S. In one octavo volume of 997 pages, with 428 illustrations. Cloth, $6.00; leather, $7.00.

To the younger members of the profession and to others not acquainted with the book and its merits, we take pleasure in recommending it as a surgery complete, thorough, well written, fully illustrated, modern, a work sufficiently voluminous for the surgeon specialist, adequately concise for the general practitioner, teaching those things that are necessary to be known for the successful prosecution of the surgeon's career, imparting nothing that in our present knowledge is considered unsafe, unscientific or inexpedient.—*Pacific Medical Journal*, July, 1889.

Hamilton on Fractures and Dislocations.—Eighth Edition.

A Practical Treatise on Fractures and Dislocations. By FRANK H. HAMILTON, M.D., LL.D., Surgeon to Bellevue Hospital, New York. Eighth edition, revised and edited by STEPHEN SMITH, M.D., Professor of Clinical Surgery in the University of the City of New York. In one octavo volume of 832 pages, with 507 illustrations. Cloth, $5.50; leather, $6.50.

Its numerous editions are convincing proof, if any is needed, of its value and popularity. It is preëminently the authority on fractures and dislocations, and universally quoted as such. In the new edition it has lost none of its former worth. The additions it has received by its recent revision make it a work thoroughly in accordance with modern practice theoretically, mechanically, aseptically. The task of writing a complete treatise on a subject of such magnitude is no easy one. Dr. Smith has aimed to make the present volume a correct exponent of our knowledge of this department of surgery. The more one reads the more one is impressed with its completeness. The work has been accomplished, and has been done clearly, concisely and excellently well.—*Boston Medical and Surgical Journal*, May 26, 1892.

Stimson's Operative Surgery.—Second Edition.

A Manual of Operative Surgery. By LEWIS A. STIMSON, B.A., M.D., Professor of Clinical Surgery in the University of the City of New York. Second edition. In one royal 12mo. volume of 503 pages, with 342 illustrations. Cloth, $2.50.

The author knows the difficult art of condensation. Thus the manual serves as a work of reference, and at the same time as a handy guide. It teaches what it professes, the steps of operations. In this edition Dr. Stimson has sought to indicate the changes that have been effected in operative methods and procedures by the antiseptic system, and has added an account of many new operations and variations in the steps of older operations. We do not desire to extol this manual above many excellent standard British publications of the same class, still we believe that it contains much that is worthy of imitation.—*British Medical Journal*, January 22, 1887.

Stimson on Fractures and Dislocations.

A Treatise on Fractures and Dislocations. By LEWIS A. STIMSON, M.D. In two handsome octavo volumes. Volume I., FRACTURES, 582 pages, 360 illustrations. Volume II., DISLOCATIONS, 540 pages, with 163 illustrations. Complete work, cloth, $5.50; leather, $7.50. Either volume separately, cloth, $3.00; leather, $4.00.

The appearance of the second volume marks the completion of the author's original plan of preparing a work which should present in the fullest manner all that is known on the cognate subjects of Fractures and Dislocations. The volume on Fractures assumed at once the position of authority on the subject, and its companion on Dislocations will no doubt be similarly received. This volume exhibits the surgery of Dislocations as it is taught and practised by the most eminent surgeons of the present time. Containing the results of such extended researches, it must for a long time be regarded as an authority on all subjects pertaining to dislocations. Every practitioner of surgery will feel it incumbent on him to have it for constant reference.—*Cincinnati Medical News*, May, 1888.

Pick on Fractures and Dislocations.

Fractures and Dislocations. By T. PICKERING PICK, F.R.C.S., Surgeon to and Lecturer on Surgery at St. George's Hospital, London. In one 12mo. volume of 530 pages, with 93 illustrations. Limp cloth, $2.00. See *Series of Clinical Manuals*, page 30.

Marsh on the Joints.

Diseases of the Joints. By HOWARD MARSH, F.R.C.S., Senior Assistant Surgeon to St. Bartholomew's Hospital, London. In one 12mo. volume of 468 pages, with 64 woodcuts and a colored plate. Cloth, $2.00. See *Series of Clinical Manuals*, page 30.

A Text-book of Ophthalmology.

By WILLIAM F. NORRIS, M.D., *Professor of Ophthalmology in the University of Pennsylvania.* and CHARLES A. OLIVER, M.D., *Surgeon to Wills Eye Hospital, Philadelphia.*

In one very handsome octavo volume of 641 pages, with 357 engravings and 5 colored plates. Cloth, $5.00; leather, $6.00. *Just Ready.*

This, the first text-book of diseases of the eye, written by American authors for American colleges and students, has just reached us. The volume is written in a style that is remarkably clear and comprehensive. Every method of ocular precision that can be of any clinical advantage to the every-day student and the scientific observer is offered to the reader. Rules and procedures for the ordinary methods of examination of the external appearances of the eye, for ophthalmoscopy, and for the application of the fundus-reflex tests, are made so plain and so evident, even to the most careless reader, that any student can easily understand and employ them. It is succinct in recital, practical in its teachings, judicious in the selection of material and conservative, yet radical when necessary. In treatment it can be accepted as from the voice and the pen of a respected and recognized authority. The illustrations, many of which are original, far outnumber those of its contemporaries, whilst the high grade and unbiased opinions of the teachings serve to give it a rank superior to any would-be competitor. Wonderfully cheap in price, beautifully printed and exquisitely illustrated, the mechanical make-up of the book is all that can be desired. After a most conscientious and painstaking perusal of the work, we unreservedly endorse it as the best, the safest and the most comprehensive volume upon the subject that has ever been offered to the American medical public. We sincerely hope that it may find its way into the list of text-books of every English-speaking college of medicine.—*Annals of Ophthalmology and Otology*, October, 1893.

Berry on the Eye.—New Edition. Just Ready.

Diseases of the Eye. A Practical Treatise for Students of Ophthalmology. By GEORGE A. BERRY, M.B., F.R.C.S., Ed., Ophthalmic Surgeon, Edinburgh Royal Infirmary. New (second) edition. In one octavo volume of 750 pages, with 197 illustrations, mostly lithographic. Cloth, $8.00.

This is by far the best work upon its theme in the English language that we have seen, for the diction is pure and clear, and, besides, the beautiful illustrations of normal and diseased conditions make it a valuable addition to the library of all practitioners, general as well as special. We have never seen more real delineation of disease, the coloring is perfect, and each illustration is an "object lesson." We have had great pleasure in the perusal of this work, and great profit, and we consider it the best on the subject in the English language to-day, not only for its diction but for its instructive illustrations.—*The American Journal of the Medical Sciences*, Aug. 1893.

Juler's Ophthalmic Science & Practice.—New Ed. Just Ready.

A Handbook of Ophthalmic Science and Practice. By HENRY E. JULER, F.R.C.S., Ophthalmic Surgeon to St. Mary's Hospital, Surgeon to the Royal Westminster Ophthalmic Hospital, London. New (second) edition, revised and enlarged. In one handsome octavo volume of 562 pages, with 201 engravings, 17 colored plates, test-types and color blindness test. Cloth, $5.50; leather, $6.50.

The continuous approval manifested toward this work testifies to the success with which the author has produced concise descriptions and typical illustrations of all the important affections of the eye. The volume is particularly rich in matter of practical value, such as directions for diagnosing, use of instruments, testing for glasses, for color blindness, etc. The sections devoted to treatment are singularly full, and at the same time concise, and couched in language that cannot fail to be understood. This edition likewise embodies such revisions and changes as were necessary to render it thoroughly representative, and moreover it has been enriched by the addition of 100 pages and 75 engravings. All told, there are 201 engravings, exclusive of 17 handsomely colored. *The Medical Age*, Nov., 1893.

Nettleship on the Eye.—Fifth Edition.

Diseases of the Eye. By EDWARD NETTLESHIP, F.R.C.S., Ophthalmic Surgeon at St. Thomas' Hospital, London. Surgeon to the Royal London (Moorfields) Ophthalmic Hospital. Fourth American from the fifth English edition, thoroughly revised. With a Supplement on the Detection of Color Blindness, by WILLIAM THOMSON, M.D., Professor of Ophthalmology in the Jefferson Medical College, Philadelphia. In one 12mo. volume of 500 pages, with 164 illustrations, selections from Snellen's test-types and formulæ, and a colored plate. Cloth, $2.00.

In the early editions this work was entitled *Student's Guide to Diseases of the Eye*, and was destined to supply students with the information most necessary during a hospital course upon this subject. Although it entered into competition with several excellent works, it rapidly passed through four editions, receiving on each occasion a thorough revision. In the present edition the author has extended the scope of the volume and has accordingly broadened the title to *Diseases of the Eye*. Four large American editions testify to the fact that it is a favorite text-book in American colleges as well as to the extent of its use among practitioners in general and special branches. Its popularity as a reference-book is due to the practical nature of its text and to the inclusion of test-types, color-blindness tests and a collection of formulæ. It is safe to predict that with the extended scope noted in its title, this handy volume will become more than ever a favorite with all classes of readers. —*Pacific Medical Journal*, December, 1890.

Eye, Ear, Throat and Nose. Cloth, $1.00. See *Students' Quiz Series*, page 30.

Carter & Frost's Ophthalmic Surgery.

Ophthalmic Surgery. By R. BRUDENELL CARTER, F.R.C.S., Lecturer on Ophthalmic Surgery at St. George's Hospital, London, and W. ADAMS FROST, F.R.C.S., Joint Lect. on Oph. Surgery at St. George's Hospital, London. In one 12mo. volume of 559 pages, with 91 woodcuts, color-blindness test, test-types and dots, and appendix of formulæ. Cloth, $2.25. See *Series of Clinical Manuals*, p. 30.

WELLS ON THE EYE. In one octavo volume.

LAWSON ON INJURIES TO THE EYE, ORBIT AND EYELIDS: Their Immediate and Remote Effects. Octavo of 404 pages, with 92 illustrations. Cloth, $3.50.

LAURENCE AND MOON'S HANDY BOOK OF OPHTHALMIC SURGERY, for the use of Practitioners. Second edition. In one octavo volume of 227 pages, with 65 illustrations. Cloth, $2.75.

Politzer on Diseases of the Ear.—New Edition. Just Ready.

A Text-Book of Diseases of the Ear and Adjacent Organs. By Dr. Adam Politzer, Imperial-Royal Professor of Aural Therapeutics in the University of Vienna, Chief of the Imperial-Royal University Clinic for Diseases of the Ear in the General Hospital, Vienna. Translated into English from the third and revised German edition, by Oscar Dodd, M.D., Clinical Instructor in Diseases of the Eye and Ear, College of Physicians and Surgeons, Chicago. Edited by Sir William Dalby, F.R.C.S., M.B., Consulting Aural Surgeon to St. George's Hospital, London. In one large octavo volume of 748 pages, with 330 original illustrations. Cloth, 5.50.

Burnett on the Ear.—Second Edition.

The Ear; Its Anatomy, Physiology and Diseases. A Practical Treatise for the Use of Medical Students and Practitioners. By Charles H. Burnett, A.M., M.D., Professor of Otology in the Philadelphia Polyclinic; President of the American Otological Society. Second edition. In one handsome octavo volume of 580 pages, with 107 illustrations. Cloth, $4.00; leather, $5.00.

We note with pleasure the appearance of a second edition of this valuable work. When it first came out it was accepted by the profession as one of the few standard works on modern aural surgery in the English language, and in his second edition Dr. Burnett has fully maintained his reputation, for the book is replete with valuable information and suggestion. The revision has been carefully carried out and much new matter added. Dr. Burnett's work must be regarded as a very valuable contribution to aural surgery, not only on account of its comprehensiveness, but because it contains the results of the careful personal observation and experience of this eminent aural surgeon.—*London Lancet*, February 21, 1885.

We are very glad, after many years' use of the first, to welcome the second edition of this excellent text-book to our shelves. The first 138 pages are devoted to a lucid account of the anatomy, histology and physiology of this most complex organ. The cuts which accompany this part of the work will prove of much use to the student. The second part of the work consists of a clear and terse account of the diseases of the ear and their treatment. In the latter department the rules laid down are eminently practical. We can cordially commend the book to all who wish a text-book on the ear.—*New Orleans Medical and Surgical Journal*, February, 1885.

Field's Manual of Diseases of the Ear.—Just Ready.

A Manual of Diseases of the Ear. By George P. Field, M.R.C.S., Aural Surgeon and Lecturer on Aural Surgery in St. Mary's Hospital Medical School, London. Fourth edition. In one octavo volume of 391 pages, with 73 engravings and 21 colored plates. Cloth, $3.75.

To those who desire a concise work on diseases of the ear, clear and practical, this manual commends itself in the highest degree. It is as far removed as well may be from the character of a compilation, every page giving evidence that the author writes from his own careful observation and thoughtful experience. It is just such a work as is needed by every general practitioner to enable him to treat intelligently the large class of cases of ear disease that comes properly within his province. The illustrations are apt and well executed while the make-up of the work is beyond criticism.—*The American Practitioner and News*, December 2, 1893.

Browne on the Throat and Nose.—New Ed. Just Ready.

The Throat and Nose and Their Diseases. By Lennox Browne, F.R.C.S., E., Senior Physician to the Central London Throat and Ear Hospital. Fourth and enlarged edition. In one imperial octavo volume of about 750 pages, with 120 illustrations in color, and 235 engravings on wood. Cloth, $6.50.

It is needless to say that it is brought up to date in the fullest possible sense of the term. Rarely has any treatise on any specialty met with a more cordial reception than the one under consideration. While the author is, like all writers of firm conviction, a trifle dogmatic at times, his mind is open to truth from every quarter, and his pages are welcome alike to the general and special worker. A most generous recognition is given to the work of American laryngologists. The main feature, perhaps, of the present edition has been the expansion of that portion which deals with the diseases of the nose. The author is to be commended on the excellence of his work, and congratulated that a new edition has been so speedily called for.—*Medical Record*, November 25, 1893.

It is an admirable presentation of its subject in the light of the large clinical experience of a careful observer. It is a book that no specialist can afford not to have, and that the general physician can rely upon as a safe guide and practical adviser.—*The Medical News*, October 14, 1893.

Seiler on the Throat and Nose.—New (4th) Edition.

A Handbook of Diagnosis and Treatment of Diseases of the Throat, Nose and Naso-Pharynx. By Carl Seiler, M.D., Lecturer on Laryngoscopy in the University of Pennsylvania. New (fourth) edition. In one handsome 12mo. volume of 414 pages, with 107 illustrations and 2 colored plates. Cloth, $2.25.

This little book is eminently practical, and will prove of interest not only to the specialist, but to the general practitioner as well. It deals with the subjects in a clear and distinct manner, and the text is copiously illustrated with diagrams and colored plates. So little attention is paid ordinarily to the examination of the larynx that the need of such a book has long been felt. By consulting its pages anyone can learn the necessary manipulations, and, by a little practice, soon become expert in the use of the laryngeal mirror, a method of examination too often neglected. The anatomy of the larynx is explained with especial care, and the operative procedures for various diseases of the throat, tonsils, etc., are carefully explained. Approved methods of treatment are dealt with in a very satisfactory way, and all the most useful remedial agents are described.—*International Medical Magazine*, November, 1893.

The fourth edition of this work is up to the required standard, which is the highest for one of its scope. It is concise and practical, treating of the commoner diseases of the throat and naso-pharynx, and presenting the salient features in an intelligible and interesting manner.—*Medical Record*, June 24, 1893.

As a guide to the practitioner and a text-book for the student, it is unexcelled, being plain, accurate, comprehensive, and pleasantly written.—*Atlanta Medical and Surgical Journal*, August, 1893.

Diseases of the Eye, Ear, Throat and Nose.

Cloth, $1.00. See *Students' Quiz Series*, page 30.

BROWNE ON KOCH'S REMEDY IN RELATION TO THROAT CONSUMPTION. In one octavo volume of 121 pages, with 45 illustrations, 4 of which are colored, and 17 charts. Cloth, $1.50.

Roberts on Urinary and Renal Diseases.—Fourth Edition.

A Practical Treatise on Urinary and Renal Diseases, including Urinary Deposits. By Sir William Roberts, M.D., Lecturer on Medicine in the Manchester School of Medicine, etc. Fourth American from the fourth London edition. In one handsome octavo volume of 609 pages, with 81 illustrations. Cloth, $3.50.

It may be said to be the best book in print on the subject of which it treats.—*The American Journal of the Medical Sciences*, January, 1886.

The peculiar value and finish of the book are in a measure derived from its resolute maintenance of a clinical and practical character. It is an unrivalled exposition of everything which relates directly or indirectly to the diagnosis, prognosis and treatment of urinary diseases, and possesses a completeness not found elsewhere in our language in its account of the different affections.—*The Manchester Medical Chronicle*, July, 1885.

Purdy on Bright's Disease and Allied Affections.

Bright's Disease and Allied Affections of the Kidneys. By Charles W. Purdy, M.D., Professor of Genito-Urinary and Renal Diseases in the Chicago Polyclinic. In one octavo volume of 288 pages, with illustrations. Cloth, $2.00.

The object of this work is to "furnish a systematic, practical and concise description of the pathology and treatment of the chief organic diseases of the kidney associated with albuminuria, which shall represent the most recent advances in our knowledge on these subjects;" and this definition of the object is a fair description of the book. The work is a useful one, giving in a short space the theories, facts and treatments, and going more fully into their later developments. On treatment the writer is particularly strong, steering clear of generalities, and seldom omitting, what text-books usually do, the unimportant items which are all important to the general practitioner.—*The Manchester Medical Chronicle*, October, 1886.

Gross on the Urinary Organs.

A Practical Treatise on the Diseases, Injuries and Malformations of the Urinary Bladder, the Prostate Gland and the Urethra. By Samuel D. Gross, M.D., LL.D., D.C.L., etc. Third edition, thoroughly revised by Samuel W. Gross, M.D. In one octavo volume of 574 pages, with 170 illustrations. Cloth, $4.50.

Morris on Surgical Diseases of the Kidney.

Surgical Diseases of the Kidney. By Henry Morris, F.R.C.S., Surgeon to the Middlesex Hospital, London. 12mo. 554 pages, with 40 woodcuts, and 6 colored plates. Limp cloth, $2.25. See *Series of Clinical Manuals*, page 30.

Thompson on the Urinary Organs.

Lectures on Diseases of the Urinary Organs. By Sir Henry Thompson, Surgeon and Professor of Clinical Surgery to University College Hospital, London. Second American from the third English edition. In one octavo volume of 203 pages, with 25 illustrations. Cloth, $2.25.

Thompson on the Pathology and Treatment of Stricture of the Urethra and Urinary Fistulæ. From the third English edition. In one octavo volume of 359 pages, with 47 engravings and 3 plates. Cloth, $3.50.

The American System of Dentistry.

In Treatises by Various Authors. Edited by Wilbur F. Litch, M.D., D.D.S., Professor of Prosthetic Dentistry, Materia Medica and Therapeutics in the Pennsylvania College of Dental Surgery. In three very handsome octavo volumes containing 3160 pages, with 1863 illustrations and 9 full-page plates. Per volume, cloth, $6.00; leather, $7.00; half Morocco, gilt top, $8.00. *For sale by subscription only.*

As an encyclopædia of Dentistry it has no superior. It should form a part of every dentist's library, as the information it contains is of the greatest value to all engaged in the practice of dentistry.—*American Journal of Dental Science*, September, 1886.

A grand system, big enough and good enough and handsome enough for a monument (which doubtless it is) to mark an epoch in the history of dentistry. Dentists will be satisfied with it and proud of it—they must. It is sure to be precisely what the student needs to put him and keep him in the right track, while the profession at large will receive incalculable benefit from it.—*Odontographic Journal*, January, 1887.

Coleman's Dental Surgery.—American Edition.

A Manual of Dental Surgery and Pathology. By Alfred Coleman, L.R.C.P., F.R.C.S., Exam. L.D.S., Senior Dental Surgeon and Lecturer on Dental Surgery at St. Bartholomew's Hospital and the Dental Hospital, London. Thoroughly revised and adapted to the use of American Students, by Thomas C. Stellwagen, M.A., M.D., D.D.S., Professor of Physiology in the Philadelphia Dental College. In one handsome octavo volume of 412 pages, with 331 illustrations. Cloth, $3.25.

It should be in the possession of every practitioner in this country. The part devoted to first and second dentition and irregularities in the permanent teeth is fully worth the price. In fact, price should not be considered in purchasing such a work. If the money put into some of our *so-called* standard text-books could be converted into such publications as this, much good would result.—*Southern Dental Journal*, May, 1882.

BASHAM ON RENAL DISEASES: A Clinical Guide to their Diagnosis and Treatment. In one 12mo. volume of 304 pages, with 21 illustrations. Cloth, $2.00.

Taylor's Clinical Atlas of Venereal and Skin Diseases.

A Clinical Atlas of Venereal and Skin Diseases: Including Diagnosis, Prognosis and Treatment. By ROBERT W. TAYLOR, A.M., M.D., Clinical Professor of Genito-Urinary Diseases in the College of Physicians and Surgeons, New York; Surgeon to the Department of Venereal and Skin Diseases of the New York Hospital; President of the American Dermatological Association. In eight large folio parts, measuring 14 x 18 inches, and comprising 58 beautifully colored plates with 213 figures, and 431 pages of text with 85 engravings. Price, per part, $2.50. Bound in one volume, half Russia, $27.00; half Turkey Morocco, $28.00. *For sale by subscription only.* Specimen plates sent on receipt of 10 cents. A full prospectus sent to any address on application.

It would be hard to use words which would perspicuously enough convey to the reader the great value of this *Clinical Atlas*. This *Atlas* is more complete even than an ordinary course of clinical lectures, for in no one college or hospital course is it at all probable that all of the diseases herein represented would be seen. It is also more serviceable to the majority of students than attendance upon clinical lectures, for most of the students who sit on remote seats in the lecture hall cannot see the subject as well as the office student can examine these true-to-life chromo-lithographs. Comparing the text to a lecturer, it is more satisfactory in exactness and fulness than he would be likely to be in lecturing over a single case. Indeed, this *Atlas* is invaluable to the general practitioner, for it enables the eye of the physician to make diagnosis of a given case of skin manifestation by comparing the case with the picture in the *Atlas*, where will be found also the text of diagnosis, pathology, and full sections on treatment.—*Virginia Medical Monthly*, December, 1889.

Taylor on Venereal Diseases.—Sixth Edition. Preparing.

The Pathology and Treatment of Venereal Diseases. Including the results of recent investigations upon the subject. By ROBERT W. TAYLOR, A.M., M.D., Clinical Professor of Genito-Urinary Diseases in the College of Physicians and Surgeons, New York, Professor of Venereal and Skin Diseases in the University of Vermont. Being the sixth edition of Bumstead and Taylor. Entirely rewritten by Dr. Taylor. Large octavo volume, about 900 pages, with about 150 engravings, as well as numerous chromo-lithographs. *In active preparation.*

Gross on Impotence, Sterility, etc.—Fourth Edition.

A Practical Treatise on Impotence, Sterility, and Allied Disorders of the Male Sexual Organs. By SAMUEL W. GROSS, A.M., M.D., LL.D., Professor of the Principles of Surgery and of Clinical Surgery in the Jefferson Medical College of Philadelphia. Fourth edition, thoroughly revised by F. R. STURGIS, M.D., Professor of Diseases of the Genito-Urinary Organs and of Venereal Diseases, New York Post-Graduate Medical School. In one octavo volume of 165 pages, with 18 illustrations. Cloth, $1.50.

Three editions of Professor Gross' valuable book have been exhausted, and still the demand is unsupplied. Dr. Sturgis has revised and added to the previous editions, and the new one appears more complete and more valuable than before. Four important and generally misunderstood subjects are treated—impotence, sterility, spermatorrhœa, and prostatorrhœa. The book is a practical one and in addition to the scientific and very interesting discussions on etiology, symptoms, etc., there are lines of treatment laid down that any practitioner can follow and which have met with success in the hands of author and editor.—*Medical Record*, February 25, 1891.

Culver & Hayden's Manual of Venereal Diseases.

A Manual of Venereal Diseases. By EVERETT M. CULVER, M.D., Pathologist and Assistant Attending Surgeon, Manhattan Hospital, New York, and JAMES R. HAYDEN, M.D., Chief of Clinic, Venereal Department, College of Physicians and Surgeons, New York. In one 12mo. volume of 289 pages, with 33 illustrations. Cloth, $1.75.

This book is a practical treatise, presenting in a condensed form the essential features of our present knowledge of the three venereal diseases, syphilis, chancroid and gonorrhea. We have examined this work carefully and have come to the conclusion that it is the most concise, direct and able treatise that has appeared on the subject of venereal diseases for the general practitioner to adopt as a guide. The general practitioner needs a few simple, concise and and clearly presented laws, in the execution of which he cannot fail either to cure or prevent the ravages of the maladies in question and their direful results.—*Buffalo Medical and Surgical Journal*, May, 1892.

Genito-Urinary and Venereal Diseases.

Cloth, $1.00. See *Students' Quiz Series*, page 30.

Cornil on Syphilis.

Syphilis, its Morbid Anatomy, Diagnosis and Treatment. By V. CORNIL, Professor to the Faculty of Medicine of Paris, and Physician to the Lourcine Hospital. Specially revised by the Author, and translated with notes and additions by J. HENRY C. SIMES, M.D., Demonstrator of Pathological Histology in the University of Pennsylvania, and J. WILLIAM WHITE, M.D., Lecturer on Venereal Diseases, University of Pennsylvania. In one handsome octavo volume of 461 pages, with 84 very beautiful illustrations. Cloth, $3.75.

Hutchinson on Syphilis.

Syphilis. By JONATHAN HUTCHINSON, F.R.S., F.R.C.S., Consulting Surgeon to the London Hospital. In one 12mo. volume of 542 pages, with 8 chromo-lithographs. Cloth, $2.25. See *Series of Clinical Manuals*, page 30.

HILL ON SYPHILIS AND LOCAL CONTAGIOUS DISORDERS. In one octavo volume of 479 pages. Cloth, $3.25.

LEE'S LECTURES ON SYPHILIS AND SOME FORMS OF LOCAL DISEASE AFFECTING THE ORGANS OF GENERATION. In one octavo volume of 246 pages. Cloth, $2.25.

Hyde on the Skin.—New (3d) Edition. Just Ready.

A Practical Treatise on Diseases of the Skin. For the use of Students and Practitioners. By J. Nevins Hyde, A.M., M.D., Professor of Dermatology and Venereal Diseases in Rush Medical College, Chicago. New (3d) edition. In one octavo volume of 802 pages, with 108 engravings and 9 full-page plates, 3 of which are colored. Cloth, $5.00; leather, $6.00.

After careful review of this work we remain deeply impressed with its excellence. The difficult themes of dermatology are treated in a masterly way, so that the reader is at a loss to know which to admire most—the scientific learning and keen clinical insight of the writer, or the delightful flow of his sentences. With the improvements of the present edition it embraces a very wide range of subjects, giving descriptions of all the familiar diseases of the skin and of a great number of rare disorders, and in all points the work is brought up to date. As a handbook of dermatology for the student, the general practitioner, or the specialist, the work will at once take its place among the very best which have yet been put forth descriptive of skin diseases as they are seen in America. In discussing methods of treatment the author avoids skilfully the two extremes of over-wordy confusion and over-bare conciseness, and gives a plain yet brief account of his own methods and those of the best specialists in dealing with each disease. The colored illustrations are excellent.—*Maryland Medical Journal*, November 4, 1893.

The author has put forth a sound, practical, good work, a better one even than the previous edition. Dr. Hyde is well known at home and abroad as an accomplished physician and a dermatologist of large experience. We take pleasure in heartily commending his work.—*The Medical News*, January 13, 1894.

We are glad to welcome this new edition of this most valuable treatise on the skin. It can best be described by saying that it is the most modern of all works on dermatology. The author has adopted the modern teaching as to bacteriology. His wide experience both as a dermatologist and a teacher enables him to present this subject in a favorable manner, and every page bears the impress of a trained mind.—*American Medico-Surgical Bulletin*, January 1, 1894.

Jackson's Ready-Reference Handbook of Skin Diseases.

The Ready-Reference Handbook of Diseases of the Skin. By George Thomas Jackson, M.D., Professor of Dermatology, Woman's Medical College of the New York Infirmary. In one 12mo. volume of 544 pages, with 50 illustrations and a colored plate. Cloth, $2.75.

Intended to serve as a reference book for the general practitioner, "no attempt has been made to discuss debateable questions," and "hence pathology and etiology do not receive as full consideration as symptomatology, diagnosis and treatment." The alphabetical arrangement of diseases, so universal now in books of this class, has been followed by Dr. Jackson, and he has inserted so many synonyms and titles from foreign languages, that the book may be turned to even by the specialist in skin diseases as a convenient dictionary of dermatological nomenclature. After a short and condensed account of the anatomy and physiology of the skin, the author presents a few notes of common and practical importance on diagnosis and therapeutics, which are followed by his well-known and graphic dermatological "Don'ts." Part II. treats in alphabetical order of the diseases of the skin and their management. This book seems to us the best of its class that has yet appeared.—*Boston Medical and Surgical Journal*, May 18, 1893.

Pye-Smith on Diseases of the Skin.—Just Ready.

A Handbook of Diseases of the Skin. By P. H. Pye-Smith, M.D., F.R.S., Physician to Guy's Hospital, London. Octavo, 407 pages, with 26 illus., 18 of which are colored. Cloth, $2.00.

The book is an excellent one, and we commend it to all interested in the subject. It is written by one entirely familiar with skin diseases, both from the stand-point of the specialist and the general practitioner. It is written in an easy and attractive style, showing familiarity with the whole field of general medicine as well as the particular diseases described, which is in striking contrast to the contents of the average handbook, from which, as a rule, the reader learns but little. Dr. Pye-Smith is favorably known as one of the eminent physicians to Guy's Hospital, and we have no hesitation in saying that he has written an original and valuable handbook of skin diseases, sound and practical in all its bearings.—*International Med. Magazine*, July, 1893.

It is a plain, practical treatise on dermatology, written for the student and general practitioner by a general practitioner of broad experience in the special subject of which he writes. By grouping the various diseases in as easy and natural a manner as possible, and dropping many of the old, confusing terms, he simplifies the nomenclature and succeeds in removing much of the difficulty that lies in the way of its study. After reviewing the recent advances made in this department of medicine, he pays a merited compliment to the "important contributions made by the newest school of dermatology, that of America."—*Pittsburg Medical Review*, June, 1893.

Hardaway's Manual of Skin Diseases.

Manual of Skin Diseases. With Special Reference to Diagnosis and Treatment. For the Use of Students and General Practitioners. By W. A. Hardaway, M.D., Professor of Skin Diseases in the Missouri Medical College. In one 12mo. volume of 440 pages. Cloth, $3.00.

Dr. Hardaway's large experience as a teacher and writer has admirably fitted him for the difficult task of preparing a book which, while sufficiently elementary for the student, is yet sufficiently thorough and comprehensive to serve as a book of reference for the general practitioner. It embraces all essential points connected with the diagnosis and treatment of diseases of the skin, and we have no hesitation in commending it as the best manual that has yet appeared in this department of medicine.—*Journal of Cutaneous and Genito-Urinary Diseases.*

Jamieson on Diseases of the Skin.—Third Edition.

Diseases of the Skin. A Manual for Students and Practitioners. By W. Allan Jamieson, M.D., Lecturer on Diseases of the Skin, School of Medicine, Edinburgh. Third edition, revised and enlarged. In one octavo volume of 656 pages, with woodcut and 9 double-page chromo-lithographic illustrations. Cloth, $6.00.

The first edition of this work appeared in 1888, and the following year a second. The scope of the work is essentially clinical, little reference being made to pathology or disputed theories. Almost every subject is followed by illustrative cases taken from the author's practice, and the reader is constantly reminded that he has before him a record of personal experience. The pages are filled with interest to all those occupied with skin diseases. The general practitioner will find the book of great value in matters of diagnosis and treatment. The latter is quite up to date, and the formulæ have been selected with care.—*Medical Record*, April 9, 1892.

Diseases of the Skin. Cloth, $1.00.

See *Students' Quiz Series*, page 30.

FOX'S EPITOME OF SKIN DISEASES. WITH FORMULÆ. Third edition, revised and enlarged. In one 12mo. volume of 238 pages. Cloth, $1.25.

HILLIER'S HANDBOOK OF SKIN DISEASES: for Students and Practitioners. Second American edition. In one 12mo. volume of 353 pages, with plates. Cloth, $2.25.

WILSON'S STUDENT'S BOOK OF CUTANEOUS MEDICINE AND DISEASES OF THE SKIN. In one handsome small octavo volume of 535 pages. Cloth, $3.50.

THE AMERICAN SYSTEMS OF

Gynecology and Obstetrics

IN TREATISES BY VARIOUS AUTHORS.

Gynecology edited by
MATTHEW D. MANN, A.M., M.D.,
Professor of Obstetrics and Gynecology in the Medical Department of the University of Buffalo.

and

Obstetrics edited by
BARTON COOKE HIRST, M.D.,
Professor of Obstetrics in the University of Pennsylvania, Philadelphia.

In four very handsome octavo volumes, containing 3612 pages, 1092 engravings and 8 plates. Complete work *now ready.* Per volume: Cloth, $5.00; leather, $6.00; half Russia, $7.00. *For sale by subscription only. Address the Publishers.* Full descriptive circular free on application.

These volumes are the contributions of the most eminent gentlemen of this country in these departments of the profession. Each contributor presents a monograph upon his special topic, so that everything in the way of history, theory, methods and results is presented to our fullest need. As a work of general reference, it will be found remarkably full and instructive in every direction of inquiry.—*The Obstetric Gazette*, September, 1889.

One is at a loss to know what to say of this volume, for fear that just and merited praise may be mistaken for flattery. The papers of Drs. Engelmann, Martin, Hirst, Jaggard and Reeve are incomparably beyond anything that can be found in obstetrical works.—*Journal of the American Medical Association*, September 8, 1888.

In our notice of the "System of Practical Medicine by American Authors," we made the following statement: "It is a work of which the profession in this country can feel proud. Written exclusively by American physicians who are acquainted with all the varieties of climate in the United States, the character of the soil, the manners and customs of the people, etc., it is peculiarly adapted to the wants of American practitioners of medicine, and it seems to us that every one of them would desire to have it." Every word thus expressed in regard to the "American System of Practical Medicine" is applicable to the "System of Gynecology by American Authors." It, like the other, has been written exclusively by American physicians who are acquainted with all the characteristics of American people, who are well informed in regard to the peculiarities of American women, their manners, customs, modes of living, etc. As every practising physician is called upon to treat diseases of females, and as they constitute a class to which the family physician must give attention, and cannot pass over to a specialist, we do not know of a work in any department of medicine that we should so strongly recommend medical men generally to purchase.—*Cincinnati Medical News*, July, 1887.

Emmet's Gynæcology.—Third Edition.

The Principles and Practice of Gynæcology; For the use of Students and Practitioners of Medicine. By THOMAS ADDIS EMMET, M.D., LL.D., Surgeon to the Woman's Hospital, New York, etc. Third edition, thoroughly revised. In one large and very handsome octavo volume of 880 pages, with 150 illustrations. Cloth, $5.00; leather, $6.00.

We are in doubt whether to congratulate the author more than the profession upon the appearance of the third edition of this well-known work. Embodying, as it does, the life-long experience of one who has conspicuously distinguished himself as a bold and successful operator, and who has devoted so much attention to the specialty, we feel sure the profession will not fail to appreciate the privilege thus offered them of perusing the views and practice of the author. His earnestness of purpose and conscientiousness are manifest. He gives not only his individual experience but endeavors to represent the actual state of gynæcological science and art.—*British Medical Journal*, May 16, 1885.

Gynecology. Cloth, $1.00.

See *Students' Quiz Series*, page 30.

Tait's Diseases of Women and Abdominal Surgery.

Diseases of Women and Abdominal Surgery. By LAWSON TAIT, F.R.C.S., Professor of Gynecology in Queen's College, Birmingham, late President of the British Gynecological Society, Fellow of the American Gynecological Society. In two octavo volumes. Volume I., 554 pages, 62 engravings and 3 plates. Cloth, $3.00. Volume II., *preparing.*

Mr. Tait never writes anything that does not command attention by reason of the originality of his ideas and the clear and forcible manner in which they are expressed. This is eminently true of the present work. Germs of truth are thickly scattered throughout; single happily worded sentences express what another author would have expanded into pages. Useful hints on the technique of surgical operations, ingenious theories on pathology, daring innovations on long-established rules—these succeed one another with a bewildering rapidity. His position has long been assured; it is hardly possible for him to add to his great reputation as a daring and original surgeon. Few reformers have ever enjoyed the present reward of their labors in such full measure as he. We cannot repress our admiration for the restless genius of the great surgeon.—*American Journal of the Medical Sciences*, June, 1890.

Edis on Diseases of Women.

The Diseases of Women. Including their Pathology, Causation, Symptoms, Diagnosis and Treatment. A Manual for Students and Practitioners. By ARTHUR W. EDIS, M.D., Lond., F.R.C.P., M.R.C.S., Assistant Obstetric Physician to Middlesex Hospital, late Physician to British Lying-in-Hospital. In one octavo volume of 576 pages, with 148 illustrations. Cloth, $3.00; leather, $4.00.

The special qualities which are conspicuous are thoroughness in covering the whole ground, clearness of description and conciseness of statement. Another marked feature of the book is the attention paid to the details of many minor surgical operations and procedures, as, for instance, the use of tents, application of leeches, and use of hot-water injections. These are among the more common methods of treatment, and yet very little is said about them in many of the text-books. The book is one to be warmly recommended, especially to students and general practitioners, who need a concise but complete *résumé* of the whole subject. Specialists, too, will find many useful hints in its pages.—*Boston Medical and Surgical Journal*, March 2, 1882.

HODGE ON DISEASES PECULIAR TO WOMEN Including Displacements of the Uterus. Second edition, revised and enlarged. In one beautifully printed octavo volume of 519 pages, with original illustrations. Cloth, $4.50.

WEST'S LECTURES ON THE DISEASES OF WOMEN. Third American from the third London edition. In one octavo volume of 543 pages. Cloth, $3.75; leather, $4.75.

Thomas & Mundé on Diseases of Women.—Sixth Edition.

A Practical Treatise on the Diseases of Women. By T. Gaillard Thomas, M.D., LL.D., Emeritus Professor of Diseases of Women in the College of Physicians and Surgeons, New York, and Paul F. Mundé, M.D., Professor of Gynecology in the New York Polyclinic. New (sixth) edition, thoroughly revised and rewritten by Dr. Mundé. In one large and handsome octavo volume of 824 pages, with 347 illustrations, of which 201 are new. Cloth, $5.00; leather, $6.00.

The profession has sadly felt the want of a text-book on diseases of women, which should be comprehensive and at the same time not diffuse, systematically arranged so as to be easily grasped by the student of limited experience, and which should embrace the wonderful advances which have been made within the last two decades. Thomas' work fulfilled these conditions, and the announcement that a new edition was about to be issued, revised by so competent a writer as Dr. Mundé, was hailed with delight. Dr. Mundé brings to his work a most practical knowledge of the subjects of which he treats and an exceptional acquaintance with the world's literature of this important branch of medicine. The result is what is, perhaps, on the whole, the best practical treatise on the subject in the English language. The original work is preserved as a basis, but amplified and enriched with the results of modern research. Much has been interspersed with the old material and several new chapters added. It is, as we have said, the best text-book we know, and will be of especial value to the general practitioner as well as to the specialist. The illustrations are very satisfactory. Many of them are new and are particularly clear and attractive. The book will undoubtedly meet with a favorable reception from the profession.—*Boston Medical and Surgical Journal*, January 14, 1892.

This work, which has already gone through five large editions, and has been translated into French, German, Spanish and Italian, is too well known to require commendation now upon the appearance of this, the sixth edition. It has been thoroughly revised and brought up to date by Dr. Mundé, who is announced as joint author. Many new illustrations have been added, and the text has been increased by the addition of new chapters. The distinctive features of the work, which made it so attractive when first issued, have in a measure been retained, so that it continues to be the most practical and at the same time the most complete treatise upon the subject in print, the changes that have been made only increasing its value.—*The Archives of Gynecology, Obstetrics and Pediatrics*, February, 1891.

Sutton on the Ovaries and Fallopian Tubes.

Surgical Diseases of the Ovaries and Fallopian Tubes, including Tubal Pregnancy. By J. Bland Sutton, F.R.C.S., Assistant Surgeon to the Middlesex Hospital, London. In one crown octavo volume of 544 pages, with 119 engravings and 5 colored plates. Cloth, $3.00.

This is not a book to be read and then shelved; it is one to be studied. It is not based upon hypotheses but upon facts. It makes pathology practical, and inculcates a practice based upon pathology. It is succinct, yet thorough; practical, yet scientific; conservative, yet bold. It is probably on the table of all gynecologists; but it is not for them alone; the general practitioner needs just such a book. It will be of immense service to him in the study of pelvic diseases, and will assuredly open his eyes to the progress made by conscientious, painstaking workers like Dr. Sutton in the field of pathology and differential diagnosis.—*International Medical Magazine*, September, 1892.

Mr. Sutton has written a book which deserves unstinted praise for the clearness with which it presents the subject and for the originality of the material. No specialist should fail to read it, and it is so written as to be of the greatest service to the general practitioner who wishes to post himself upon the subject of which it treats.—*New York Journal of Gynecology and Obstetrics*, June, 1892.

Davenport's Non-Surgical Gynecology.—Second Edition.

Diseases of Women, a Manual of Non-Surgical Gynecology. Designed especially for the Use of Students and General Practitioners. By Francis H. Davenport, M.D., Assistant in Gynecology in the Medical Department of Harvard University, Boston. Second edition. In one handsome 12mo. volume of 314 pages, with 107 illustrations. Cloth, $1.75.

The first edition of Dr. Davenport's book, which was published three years ago, evidently met with the reception it deserved, or the second edition would not have followed so soon. The title is an attractive one, and the contents are of value to the student and general practitioner. One advantage of it is that it teaches the physician or the student how to do the little things, or to remedy the minor evils in connection with gynecology. In these days, when major gynecology is so largely practised, minor gynecology is too frequently ignored. To those in the profession who are about to interest themselves particularly in this branch of surgery, and to the student who in the future intends to make gynecology his life-work, we believe that Davenport's book will be essential to his success, because it will teach him facts which larger works sometimes ignore.—*The Therapeutic Gazette*, October 15, 1892.

Many valuable volumes already exist on the surgical aspects of gynecology, but scant attention has been paid in recent years to the non-surgical treatment of women's diseases. The present volume, dealing with nothing which has not stood the actual test of experience, and being concisely and clearly written, conveys a great amount of information in a convenient space.—*Annals of Gynæcology and Pædiatry*, June, 1893.

May's Manual of Diseases of Women.—Second Edition.

A Manual of the Diseases of Women. Being a Concise and Systematic exposition of the Theory and Practice of Gynecology. By Charles H. May, M.D., late House Surgeon to Mount Sinai Hospital, New York. Second edition, edited by L. S. Rau, M.D., Attending Gynecologist at the Harlem Hospital, New York. In one 12mo. volume of 360 pages, with 31 illustrations. Cloth, $1.75.

The classification is so clear that the purpose of enabling the student to review the subject, or the practitioner rapidly to refresh his memory, is admirably fulfilled. Taking as authority some of the best systematic writers, and giving in the main an opinion which is a consensus, there is an absence of personal bias which is not the least valuable point in the work. The book meets its purpose. Whole chapters have been written in other works without expressing more ideas than do pages in this.—*American Journal of the Medical Sciences*, August, 1890.

Duncan on Diseases of Women.

Clinical Lectures on the Diseases of Women; Delivered in St. Bartholomew's Hospital. By J. Matthews Duncan, M.D., LL.D., F.R.S.E., etc. In one octavo volume of 175 pages. Cloth, $1.50.

ASHWELL'S PRACTICAL TREATISE ON THE DISEASES PECULIAR TO WOMEN. Third American from the third and revised London edition. In one octavo volume of 520 pages. Cloth, $3.50.

Playfair's Midwifery.—New (8th) Edition. Just Ready.

A Treatise on the Science and Practice of Midwifery. By W. S. PLAYFAIR, M.D., F.R.C.P., Professor of Obstetric Medicine in King's College, London. Sixth American from the eighth English edition. Edited, with additions, by ROBERT P. HARRIS, M.D. In one very handsome octavo volume, of 697 pages, with 217 engravings and 5 plates. Cloth, $4.00; leather, $5.00.

The demand for eight English and six American editions of this standard work, in seventeen years testifies to the success with which the author has executed his original purpose. His object "has been to place in the hands of his readers an epitome of the science and practice of midwifery which embodies all recent advances." He has "endeavored to dwell especially on the practical part of the subject, so as to make the work a useful guide in this most anxious and responsible branch of the profession." The present issue is the result of a thorough revision of its predecessor at the hands of the author. It has likewise received the benefit of careful revision by Dr. Robert P. Harris, of Philadelphia, whose annotations in this and in previous editions have covered the points wherein American practice differs from that of English obstetricians. The work will continue to be a favorite text-book for the student and a trustworthy guide for the practitioner.—*Memphis Medical Monthly*, December, 1893.

In the method of treating its theme, that is in clearness, perspicuity, in a smooth-flowing and yet terse literary style, notwithstanding the great number of new claimants in the field, this work still stands without a superior. The teachings on the various forms of anomalous and difficult labors are clear, full, and explicit, and these practical matters bear the full stamp of the author's high authority. A book that already has the praise of the civilized world.—*The American Practitioner and News*, December 16, 1893.

Parvin's Art and Science of Obstetrics.—Second Edition.

The Science and Art of Obstetrics. By THEOPHILUS PARVIN, M.D., LL.D., Professor of Obstetrics and the Diseases of Women and Children in Jefferson Medical College, Philadelphia. Second edition. In one handsome octavo volume of 701 pages, with 239 engravings and a colored plate. Cloth, $4.25; leather, $5.25.

Through his many able contributions to obstetric literature and by reason of his eminence and popularity as a teacher and practitioner, the author of this volume is well known to the profession of America and obstetricians everywhere. Among his many great efforts this work is his master-piece. He has handled this subject, upon which so much has been written, with an attractiveness that is far from common. The science and art of obstetrics have been well and fully demonstrated. The more difficult and abstruse branches have been accorded deserved attention, while the minutiæ, the very little points so important to the practitioner at the bedside, yet so generally ignored by writers, have not been neglected. A number of new cuts have been inserted, and the treatment of every subject is in a manner so clear, so direct, so complete, that little is left to be told and nothing could be told better. The work is therefore, in our estimation, one of the most valuable and trustworthy to which the obstetrician can appeal.—*Pacific Medical Journal*, November, 1890.

The second edition of this work, following so soon after its first publication, demonstrates its real value and the favor bestowed upon it by the profession. We regard it as the most valuable text-book for the student of medicine yet published. The author has been a most successful teacher for a long period, and the discipline and training of the lecture room are observed in the clearness with which the often-obscure principles of the science and art of obstetrics are presented to the comprehension of the undergraduate. We think this feature is one of the strongest in the work and commends it especially to teachers. The present edition is greatly improved and embodies all the advances made in this important department of medicine up to the time of its publication.—*Buffalo Medical and Surgical Journal*, December, 1890.

King's Manual of Obstetrics.—Fifth Edition.

A Manual of Obstetrics. By A. F. A. KING, M.D., Professor of Obstetrics and Diseases of Women in the Medical Department of the Columbian University, Washington, D.C., and in the University of Vermont, etc. New (fifth) edition. In one 12mo. volume of 446 pages, with 150 illustrations. Cloth, $2.50.

So comprehensive a treatise could not be brought within the limits of a book of this size were not two things especially true. First, Dr. King is a teacher of many years' experience, and knows just how to present his subjects in a manner for them to be best received; and, secondly, he can put his ideas in a clear and concise form. In other words, he knows how to use the English language. He gives us the plain truth, free from unnecessary ornamentation. Therefore he says there are nine hundred pages of matter between the covers of this manual of four hundred and fifty pages. We cannot imagine a better manual for the hard-worked student, while its clear and practical teachings make it invaluable to the busy practitioner. The illustrations add much to the subject matter.—*The National Medical Review*, October, 1892.

This deservedly popular manual has rapidly passed through five editions since its first appearance ten years ago. It is essentially a book for students' use, and is one of the very best of its kind. Its scope in topics is particularly wide, and, though each topic is necessarily treated in a brief manner, it forms an excellent index, so to say, to the complete study of obstetrics. The present edition bears marks of revision, several illustrations having been added and the text amplified.—*The Chicago Medical Recorder*, October, 1892.

Barnes' System of Obstetric Medicine and Surgery.

A System of Obstetric Medicine and Surgery, Theoretical and Clinical. For the Student and the Practitioner. By ROBERT BARNES, M.D., Physician to the General Lying-in Hospital, London, and FANCOURT BARNES, M.D., Obstetric Physician to St. Thomas' Hospital, London. The Section on Embryology by Professor Milnes Marshall. In one octavo volume of 872 pages with 231 illustrations. Cloth, $5.00; leather, $6.00.

Obstetrics. Cloth, $1.00. See *Students' Quiz Series*, page 30.

Landis on Labor and the Lying-in Period.

The Management of Labor, and of the Lying-in Period. By HENRY G. LANDIS, A.M., M.D., Professor of Obstetrics and the Diseases of Women in Starling Medical College, Columbus, Ohio. In one handsome 12mo. volume of 334 pages, with 28 illustrations. Cloth, $1.75.

WINCKEL'S COMPLETE TREATISE ON THE PATHOLOGY AND TREATMENT OF CHILDBED. For Students and Practitioners. Translated from the second German edition, by J. R. CHADWICK, M.D. In one octavo volume of 481 pages. Cloth, $1.00.

Smith on Diseases of Children.—Seventh Edition.

A Treatise on the Diseases of Infancy and Childhood. By J. Lewis Smith, M.D., Clinical Professor of Diseases of Children in the Bellevue Hospital Medical College, New York. Seventh edition, thoroughly revised and rewritten. In one handsome octavo volume of 881 pages, with 51 illustrations. Cloth, $4.50; leather, $5.50.

We have always considered Dr. Smith's book as one of the very best on the subject. It has always been practical—a field book, theoretical where theory has been deduced from practical experience. He takes his theory from the bedside and the pathological laboratory. The very practical character of this book has always appealed to us. It is characteristic of Dr. Smith in all his writings to collect whatever recommendations are found in medical literature, and his search has been wide. One seldom fails to find here a practical suggestion after search in other works has been in vain. In the seventh edition we note a variety of changes in accordance with the progress of the times. It still stands foremost as *the* American text-book. Its advice is always conservative and thorough, and the evidence of research has long since placed its author in the front rank of medical teachers.—*The American Journal of the Medical Sciences*, December, 1891.

In the present edition we notice that many of the chapters have been entirely rewritten. Full notice is taken of all the recent advances that have been made. Many diseases not previously treated of have received special chapters. The work is a very practical one. Especial care has been taken that the directions for treatment shall be particular and full. In no other work are such careful instructions given in the details of infant hygiene and the artificial feeding of infants.—*Montreal Medical Journal*, February, 1891.

Already in previous editions the treatise of Dr. Smith on Diseases of Children held position undisputed at the head of its class. No book in any language could dispute with it the title to preëminence. A list of works on diseases of children, made up in any country, would have this work at its head, and for the purposes of the great majority of practitioners the list would be complete with this one alone.—*The American Practitioner and News*, May 9, 1891.

As a text-book for students and a guide for young practitioners it is unsurpassed.—*Buffalo Medical and Surgical Journal*, January, 1891.

Diseases of Children. Cloth, $1.00. See *Students' Quiz Series*, page 30.

Herman's First Lines in Midwifery.

First Lines in Midwifery: a Guide to Attendance on Natural Labor for Medical Students and Midwives. By G. Ernest Herman, M.B., F.R.C.P., Obstetric Physician to the London Hospital. In one 12mo. volume of 198 pages, with 80 illustrations. Cloth, $1.25. See *Students' Series of Manuals*, page 30.

This little book is intended for the use of midwives and for the guidance of medical students in the care of normal cases. The author is the well-known lecturer on obstetrics to the London Hospital, and he has produced a manual which will prove extremely useful to those for whom it has been prepared. The book is replete with practical advice, and no student can go wrong who follows its teachings. Much stress has been laid on the now generally approved aseptic management of labor; and it is clearly pointed out in what complications the student should send for assistance. The book is well made and fully illustrated.—*The Boston Medical and Surgical Journal*, February 9, 1893.

Owen on Surgical Diseases of Children.

Surgical Diseases of Children. By Edmund Owen, M.B., F.R.C.S., Surgeon to the Children's Hospital, Great Ormond Street, London. In one 12mo. volume of 525 pages, with 4 chromo-lithographic plates and 85 woodcuts. Cloth, $2.00. See *Series of Clinical Manuals*, page 30.

It would not be easy on any subject to find a more clearly written work, where every word and sentence tells, and from which it seems few could be spared. The work is truly a conspectus of the branch of which it treats, and covers the field in a way that is done by no other, presenting the gist of what is known of every surgical affection to which childhood and infancy are liable.—*The American Practitioner and News*, November 13, 1886.

Hartshorne's Conspectus of the Medical Sciences.

A Conspectus of the Medical Sciences; Containing Handbooks on Anatomy, Physiology, Chemistry, Materia Medica, Practice of Medicine, Surgery and Obstetrics. By Henry Hartshorne, A.M., M.D., LL.D., lately Professor of Hygiene in the University of Pennsylvania. Second edition, thoroughly revised and greatly improved. In one large royal 12mo. volume of 1028 pages, with 477 illustrations. Cloth, $4.25; leather, $5.00.

Ludlow's Manual of Examinations.

A Manual of Examinations upon Anatomy, Physiology, Surgery, Practice of Medicine, Obstetrics, Materia Medica, Chemistry, Pharmacy and Therapeutics. To which is added a Medical Formulary. By J. L. Ludlow, M.D., Consulting Physician to the Philadelphia Hospital, etc. Third edition, thoroughly revised, and greatly enlarged. In one 12mo. volume of 816 pages, with 370 illustrations. Cloth, $3.25; leather, $3.75.

CONDIE'S PRACTICAL TREATISE ON THE DISEASES OF CHILDREN. Sixth edition, revised and augmented. In one octavo volume of 779 pages. Cloth, $5.25; leather, $6.25.

LEISHMAN'S SYSTEM OF MIDWIFERY, INCLUDING THE DISEASES OF PREGNANCY AND THE PUERPERAL STATE. Fourth edition. Octavo.

WEST ON SOME DISORDERS OF THE NERVOUS SYSTEM IN CHILDHOOD. In one small 12mo. volume of 127 pages. Cloth, $1.00.

PARRY ON EXTRA-UTERINE PREGNANCY: Its Clinical History, Diagnosis, Prognosis and Treatment. Octavo, 272 pages. Cloth, $2.50.

RAMSBOTHAM'S PRINCIPLES AND PRACTICE OF OBSETRIC MEDICINE AND SURGERY. In Reference to the Process of Parturition. A new and enlarged edition, thoroughly revised by the author. With additions by W. V. Keating, M.D., Professor of Obstetrics, etc., in the Jefferson Medical College of Philadelphia. In one large and handsome imperial octavo volume of 640 pages, with 64 full-page plates and 43 woodcuts in the text, containing in all nearly 200 beautiful figures. Strongly bound in leather, with raised bands, $7.

CHURCHILL ON THE PUERPERAL FEVER AND OTHER DISEASES PECULIAR TO WOMEN. In one octavo volume of 464 pages. Cloth, $2.50.

TANNER ON PREGNANCY. Octavo, 490 pages, colored plates, 16 cuts. Cloth, $4.25.

The Students' Quiz Series.

A NEW Series of Manuals, comprising all departments of medical science and practice, and prepared to meet the needs of students and practitioners. Written by prominent medical teachers and specialists in New York, these volumes may be trusted as authoritative and abreast of the day. They enjoy the unique advantage of issue under careful editorial supervision which gives assurance, not only of accuracy, but of the completeness of the Series as a whole, and of the compactness of each volume by the avoidance of duplication. Cast in the form of suggestive questions, and concise and clear answers, the text will impress vividly upon the reader's memory the salient points of his subject, and the prominent and uniform headings will facilitate instant reference to any topic. To the student these volumes will be of the utmost service in preparing for examinations, and they will also be of great use to the practitioner in recalling forgotten details, and in gaining the latest knowledge, whether in theory or in the actual treatment of disease. Nothing has been left undone to make them in type and illustration most attractive and convenient for the eye and mind. Handsomely bound in limp cloth, and in size suitable for the hand and pocket, these volumes are assured of enormous popularity, and are accordingly placed at an exceedingly low price in comparison with their value. For details of subjects and prices see below.

ANATOMY (*Double Number*)—By FRED J. BROCKWAY, M.D., Assistant Demonstrator of Anatomy, College of Physicians and Surgeons, New York, and A. O'MALLEY, M.D., Instructor in Surgery, New York Polyclinic. $1.75.

PHYSIOLOGY—By F. A. MANNING, M.D., Attending Surgeon, Manhattan Hospital, N. Y. $1.

CHEMISTRY AND PHYSICS—By JOSEPH STRUTHERS, Ph. B., Columbia College School of Mines, N.Y., and D. W. WARD, Ph. B., Columbia College School of Mines, N. Y., and CHARLES H. WILLMARTH, M.S., N. Y. $1.

HISTOLOGY, PATHOLOGY AND BACTERIOLOGY—By BENNETT S. BEACH, M.D., Lecturer on Histology, Pathology and Bacteriology, New York Polyclinic. $1.

MATERIA MEDICA AND THERAPEUTICS—By L. F. WARNER, M.D., Attending Physician, St. Bartholomew s Dispensary, N.Y. $1.

PRACTICE OF MEDICINE, INCLUDING NERVOUS DISEASES—By EDWIN T. DOUBLEDAY, M.D., Member N. Y. Pathological Society, and J. D. NAGEL, M.D., Member N. Y. County Medical Association. $1.

SURGERY (*Double Number*)—By BERN B. GALLAUDET, M.D., Visiting Surgeon, Bellevue Hospital, New York, and CHARLES DIXON JONES, M.D., Surgeon Yorkville Dispensary, New York. $1.75.

GENITO-URINARY AND VENEREAL DISEASES—By CHARLES H. CHETWOOD, M.D., Visiting Surgeon, Demilt Dispensary, Department of Surgery and Genito-Urinary Diseases, New York. $1.

DISEASES OF THE SKIN—By CHARLES C. RANSOM, M.D., Assistant Dermatologist, Vanderbilt Clinic, New York. $1.

DISEASES OF THE EYE, EAR, THROAT AND NOSE—By FRANK E. MILLER, M.D., Throat Surgeon, Vanderbilt Clinic, New York, and JAMES P. McEVOY, M.D., Throat Surgeon, Bellevue Hospital, Out-Patient Department, New York, and J. E. WEEKS, M.D., Lecturer on Ophthalmology and Otology, Bellevue Hospital Medical College. New York. $1.

OBSTETRICS—By CHARLES W. HAYT, M.D., House Physician, Nursery and Child's Hospital, New York. $1.

GYNECOLOGY—By G. W. BRATENAHL, M.D., Assistant in Gynecology, Vanderbilt Clinic, New York, and SINCLAIR TOUSEY, M.D., Assistant Surgeon, Out-Patient Department, Roosevelt Hospital, New York. $1.

DISEASES OF CHILDREN—By C. A. RHODES, M.D., Instructor in Diseases of Children, New York Post-Graduate Medical College. $1.

For special circulars, with full information and specimen pages, address the Publishers.

The *Student's Quiz Series* enables a man in practice to give himself an occasional quiz and see how much he has forgotten. It is intended, however, more particularly for the use of the student, not only to show how much he has yet to learn, but to make its accomplishment easier; to enable him to give his whole attention to lectures on these subjects without note-taking, and to go over in a condensed form, before an examination or quiz, the essential facts pertaining to the special branch.—*Medical Record*, June 3, 1893.

This series of *Quiz-Compends* is undoubtedly the best that is published. They will repay the practitioner as well as the student for the time spent in a careful study of them, while to the lecturer or author they will very materially lessen his labors by presenting to him his subject in a brief and classified manner.—*Cincinnati Med. Jour.*, May 15, 1893.

Those who desire to review the salient points of medicine can do so by means of these books in the shortest possible time. The form of question and answer crystallizes the information they contain.—*Brooklyn Med. Jour*, April, 1893.

Such books serve a useful purpose, not only to the student preparing for examination but to the practitioner, in recalling the more salient characteristics of the affections under consideration.—*Journal of Cutaneous and Genito-Urinary Diseases*, February, 1893.

We know of no series that we would recommend more highly.—*Memphis Medical Monthly*, Feb. 1893.

Student's Series of Manuals.

A Series of Fifteen Manuals, for the use of Students and Practitioners of Medicine and Surgery, written by eminent Teachers or Examiners, and issued in pocket-size 12mo volumes of 300-540 pages, richly illustrated and at a low price. The following volumes are now ready: LUFF'S *Manual of Chemistry*, $2.; HERMAN'S *First Lines in Midwifery*, $1.25; TREVES' *Manual of Surgery*, by various writers, in three volumes, per set, $6; BELL'S *Comparative Anatomy and Physiology*, $2; GOULD'S *Surgical Diagnosis*, $2; ROBERTSON'S *Physiological Physics*, $2; BRUCE'S *Materia Medica and Therapeutics* (fifth edition), $1.50; POWER'S *Human Physiology* (second edition), $1.50; CLARKE and LOCKWOOD'S *Dissector's Manual*, $1.50; RALFE'S *Clinical Chemistry*, $1.50; TREVES' *Surgical Applied Anatomy*, $2; PEPPER'S *Surgical Pathology*, $2; and KLEIN'S *Elements of Histology* (fourth edition), $1.75. The following is in press: PEPPER'S *Forensic Medicine*. For separate notices see index on last page.

Series of Clinical Manuals.

In arranging for this Series it has been the design of the publishers to provide the profession with a collection of authoritative monographs on important clinical subjects in a cheap and portable form. The volumes contain about 550 pages and are freely illustrated by chromo-lithographs and woodcuts. The following volumes are now ready: YEO on *Food in Health and Disease*, $2; BROADBENT on the *Pulse*, $1.75; CARTER & FROST'S *Ophthalmic Surgery*, $2.25; HUTCHINSON on *Syphilis*, $2.25; MARSH on the *Joints*, $2; OWEN on *Surgical Diseases of Children*, $2; MORRIS on *Surgical Diseases of the Kidney*, $2.25; PICK on *Fractures and Dislocations*, $2; BUTLIN on the *Tongue*, $3.50; TREVES on *Intestinal Obstruction*, $2; and SAVAGE on *Insanity and Allied Neuroses*, $2. The following is in preparation: LUCAS on *Diseases of the Urethra*. For separate notices see index on last page.

Taylor's Medical Jurisprudence.—New Edition. Just Ready.

A Manual of Medical Jurisprudence. By ALFRED S. TAYLOR, M.D., Lecturer on Medical Jurisprudence and Chemistry in Guy's Hospital, London. New American from the twelfth English edition. Thoroughly revised by CLARK BELL, Esq., of the New York Bar. In one octavo volume of 787 pages, with 56 illustrations. Cloth, $4.50; leather, $5.50.

This is a complete revision of all former American and English editions of this standard book. This edition contains a large amount of entirely new matter, many portions of the book having been rewritten by the editor. Many cases and authorities have been cited, and the citations brought down to the latest date. The book has so long been a standard treatise on the subject of medical jurisprudence, and has gone through so many editions—twelve English and eleven American—that there is little left to criticise, unless it is to note the admirable manner in which Mr. Clark Bell, in editing this edition, has enlarged and improved what already seemed complete, by bringing his many citations of cases down to date to meet the present law; and by adding much new matter he has furnished the medical profession and the bar with a valuable book of reference, one to be relied upon in daily practice, and quite up to the present needs, owing to its exhaustive character. It would seem that the book is indispensable to the library of both physician and lawyer, and particularly the legal practitioner whose duties take him into the criminal courts. Too much praise cannot be given to the editor for his thorough and painstaking labors, by which he has given to two professions a reference-book to be relied upon.—*The American Journal of the Medical Sciences*, April, 1893.

No library is complete without Taylor's *Medical Jurisprudence*, as its authority is accepted and unquestioned by the courts.—*Buffalo Medical and Surgical Journal*, June, 1893.

There is no other work upon the subject which has been so uniformly recognized or so widely quoted and followed by courts in England and this country. It would have been impossible to select anyone in this country better fitted for the task of revision than Mr. Bell. Profiting by the labors with which Dr. Stevenson has enriched the twelfth English edition, he has, in this eleventh American edition, given us a book fully abreast with the most recent thought and knowledge. On the basis of his own researches, of the investigations of scientists throughout the world, and of the decisions of our own courts, he has incorporated in it a wealth of practical suggestion and instructive illustration which cannot fail to strengthen the hold it has so long had upon the profession.—*The Criminal Law Magazine and Reporter*, January, 1893.

BY THE SAME AUTHOR.

Poisons in Relation to Medical Jurisprudence and Medicine. Third American, from the third and revised English edition. In one large octavo volume of 788 pages. Cloth, $5.50; leather, $6.50.

Lea's Superstition and Force.—New Edition. Just Ready.

Superstition and Force: Essays on the Wager of Law, The Wager of Battle, The Ordeal and Torture. By HENRY CHARLES LEA, LL.D. New (fourth) edition, revised and enlarged. Royal 12mo., 629 pages. Cloth, $2.75.

Both abroad and at home the work has been accepted as a standard authority, and the author has endeavored, by a complete revision and considerable additions, to render it more worthy of the universal favor which has carried it to a fourth edition. The style is severe and simple, and yet delights with its elegance and reserved strength. The known erudition and fidelity of the author are guarantees that all possible original sources of information have been not only consulted but exhausted. The subject matter is handled in such an able and philosophic manner that to read and study it is a step toward liberal education. It is a comfort to read a book that is so thorough, well conceived and well done. We should like to see it made a text-book in our law schools and prescribed course for admission to the bar.—*Legal Intelligencer*, March 3, 1893.

BY THE SAME AUTHOR.

Chapters from the Religious History of Spain. In one 12mo. vol. of 522 pages. Cloth, $2.50.

The width, depth and thoroughness of research which have earned Dr. Lea a high European place as the ablest historian the Inquisition has yet found are here applied to some side-issues of that great subject. We have only to say of this volume that it worthily complements the author's earlier studies in ecclesiastical history. His extensive and minute learning, much of it from inedited manuscripts in Mexico, appears on every page.—*London Antiquary*, January, 1891.

The Formulary of the Papal Penitentiary. In one octavo volume of 221 pages, with a frontispiece. Cloth, $2.50. *Just ready.*

Few medieval documents, says the editor, have seemed so instructive in so many ways. In truth, this collection of 358 cases of penance is extremely varied and suggestive. I would like to condemn all the despisers of modern society and all the thoughtless apologists of the medieval Church to read and reflect on the *Forme Romane curie super casibus penitentie*, if only to convince them that the Christian society of the Nineteenth Century, so much decried, in spite of all its defects and all its shame, is infinitely superior to the Christian society of the Thirteenth Century.—*Revue de l'Histoire des Religions*, June, 1893.

Studies in Church History. The Rise of the Temporal Power—Benefit of Clergy—Excommunication—The Early Church and Slavery. Second and revised edition. In one royal octavo volume of 605 pages. Cloth, $2.50.

The author is preëminently a scholar; he takes up every topic allied with the leading theme and traces it out to the minutest detail with a wealth of knowledge and impartiality of treatment that compel admiration. The amount of information compressed into the book is extraordinary, and the profuse citation of authorities and references makes the work particularly valuable to the student who desires an exhaustive review from original sources. In no other single volume is the development of the primitive church traced with so much clearness and with so definite a perception of complex or conflicting forces.—*Boston Traveller.*

An Historical Sketch of Sacerdotal Celibacy in the Christian Church. Second edition, enlarged. In one octavo volume of 685 pages. Cloth, $4.50.

This subject has recently been treated with very great learning and with admirable impartiality by an American author, Mr. Henry C. Lea, in his *History of Sacerdotal Celibacy*, which is certainly one of the most valuable works that America has produced. Since the great history of Dean Milman, I know no work in English which has thrown more light on the moral condition of the Middle Ages, and none which is more fitted to dispel the gross illusions concerning that period which positive writers and writers of a certain ecclesiastical school have conspired to sustain.—*Lecky's History of European Morals*, Chapter V.
